

BULLETIN NO. 17

SEPTEMBER, 1920

Crop Report for Colorado

U. S. Department of Agriculture

Bureau of Crop Estimates

Leon M. Estabrook, *Chief*

W. W. Putnam, *Agricultural Statistician*

In Cooperation with

Colorado State Board of Immigration

Division of Agricultural Statistics

Edward D. Foster, *Commissioner*

Howard D. Sullivan, *Deputy*

General Conditions: The condition of all crops in Colorado on September 1 was equal to or better than August 1, with the exception of spring wheat, barley and peaches; and nearly all crops are higher than last year on September 1 and higher than the 5 and 10-year averages. Revisions of acreage figures, which will be made in December, will show increases over preliminary figures in winter wheat, corn, barley, oats and possibly in the sorghums, while decreases will be shown in spring wheat, alfalfa, beans and possibly potatoes. The total area in cultivation in the state is above 5,500,000 acres. If favorable harvest conditions prevail in line with the present outlook for large production, and if favorable prices are received for products, the value of all farm and orchard crops grown this year will be above \$240,000,000, compared with a final estimate of \$191,000,000 last year. The composite condition of all crops in Colorado on September 1 was 107.9% of the average condition for that date, there having been a 2.2% improvement during the month of August. In the United States the composite condition of all crops on September 1 was 107.0% of the average, an improvement of 1.7% during August. The total production of important products compared with last year in the United States is estimated as follows: Corn, 107.3%; Wheat, 81.8%; Oats, 115.5%; Barley, 117.6%; Rye, 88.0%; Buckwheat, 95.1%; Potatoes, 115.4%; Sweet Potatoes, 98.3%; Flaxseed, 132.3%; Rice, 127.7%; Hay (all), 98.0%; Clover Seed, 131.8%; Sugar Beets, 100.3%; Cotton, 113.3%; Beans, 79.1%; Peanuts, 116.8%. The level of prices paid producers of the United States for the principal crops decreased about 10.6% during August; in the past ten years the price level decreased about 1.2% during August. On September 1 the index figure of prices was about 7.2% lower than a year ago, 0.5% higher than two years ago and 56.9% higher than the average of the past ten years on September 1.

Corn—The condition of corn in Colorado on September 1 was 92 per cent of normal, compared with 90 per cent on August 1 and 62 per cent September 1 last year and 79 per cent the ten year average.

If conditions remain favorable and there is no frost much before the last of September, the production of corn in Colorado will be the largest in the history of the state. Based upon preliminary estimates from reports of county assessors, the area devoted to the crop in Colorado this year is estimated at 1,102,000 acres. In 1919 it was estimated that only about 64 per cent of the crop was harvested for grain, the remainder being cut for silage or fodder, hogged-off or abandoned. Based upon this percentage of corn for grain, or 705,000 acres, and upon the condition, the estimated production is 16,022,000 bushels, compared with a final estimate of 11,206,000 bushels last year. If there is no material damage from frost it is probable that a greater percentage of this year's corn crop will be harvested for grain than was harvested for grain last year, in which case the grain production will be greatly increased. Inquiries will be made later in the season to determine the percentages of the crop that fall in the classes above mentioned.

Wheat—The condition of spring wheat depreciated from 90 per cent of normal on August 1 to 85 per cent on September 1, compared with 65 per cent September 1 last year and 82 per cent the ten year average. Based upon the condition of 85 per cent and 395,000 acres the forecast of production for spring wheat is 8,394,000 bushels, which, added to the forecast of 17,220,000 bushels of winter wheat makes a total forecast for all wheat in Colorado this year of 25,614,000 bushels, compared with a final estimate of 17,645,000 bushels last year—the largest crop of wheat in the state to that date. Final figures will probably show considerable increase in the acreage devoted to winter wheat and may increase the estimated production slightly; while the final figures on the acreage devoted to spring wheat will probably be lower and the production proportionately less. The final figures on all wheat will likely show a slight increase.

Oats, Barley, Rye, Grain Sorghums, Sweet Sorghums, Beans, Broom Corn and several of the minor crops show no material changes from the estimates of August 1, and the estimates on these crops can be readily understood without further comment by reference to the figures in the general summary table on pages 15 and 16.

All Hay—The principal figures upon the acreages and production of all hay and alfalfa are available in the summary on pages 15 and 16. Average yields of all classes of hay are estimated higher this year than last and higher than the averages for preceding years. The average per acre for all tame hay being 2.4 tons per acre, compared with 2.2 in 1919 and 2.2 the ten-year average; and for wild hay, 1.16 ton this year, compared with 1.0 ton in 1919 and 1.01 tons the nine-year average; while timothy is estimated at 2.2 tons, compared with 1.1 tons last year and 2.0 tons in 1918. The acreage devoted to timothy in the state this year is 122,000 acres, or 98 per cent of the acreage of last year. The preliminary estimate of the acreage devoted to tame hay in Colorado this year is 1,076,000 acres, or 101 per cent of last year, and the acreage devoted to wild hay is 367,000 acres, or 102 per cent of last year.

Potatoes, Sugar Beets and Fruit figures are available in the summary table on pages 15 and 16. These figures are higher for September 1 than for August 1 on potatoes, sugar beets, apples and pears, and slightly lower prospects for peaches.

The figures for other miscellaneous important United States crops, not grown commercially in Colorado but somewhat competitive with Colorado crops, are represented at the end of the summary table, page 16.

Swine—The estimated number of hogs for fattening in Colorado on September 1 was 202,230, or 85 per cent of that of last year, and in the United States was 91.1 per cent of the number on hand a year ago, or 56,549,000, compared with 62,073,000 last year.

Wool—The total production of wool for 1920 in Colorado as compared with 1919 is estimated at 80 per cent, or about 6,252,000 pounds. In the United States the total production of wool is estimated as 97.5 per cent of last year, or 258,824,000 pounds.

REPORTS OF COUNTY ASSESSORS ON CROP ACREAGES.

On pages 5 to 12 inclusive of this Bulletin will be found tables showing the acreage by counties of the principal crops grown in Colorado in 1920, as reported to the State Board of Immigration by county assessors. A comparison of these acreage figures with those published in the Crop Bulletin in August and December last year will show that there is an increase in the total cultivated acreage reported for 1920 over that reported for 1919, and an increase in the acreage reported for all the principal crops except potatoes, beans, spring wheat and field peas. There are slight decreases in the acreages reported for some of the minor crops, but substantial increases are shown for all the leading major crops, such as winter wheat, corn, sorghums and alfalfa.

These increases are due partly to the fact that reports of county assessors are somewhat more complete this year than they were last year, there being approximately 50,000 farms reported in 1920, compared with 47,879 in 1919. There seems to be little doubt, however, that the acreage in cultivation in the state this year is actually greater than that cultivated last year, and as a result of the more favorable season this year the acreage for harvest in 1920 is considerably larger than that harvested in 1919.

Yet a comparison of the figures for this year by counties with those for last year will show that not all assessors have made an improvement in their 1920 reports. A few counties, like Yuma, Las Animas, Garfield, Montrose, Delta, Mesa and Baca, have shown large increases in the number of farm schedules reported as well as in cultivated acreage. On the other hand a number of counties, like Larimer, La Plata, Adams, Jefferson and Conejos, have reported fewer farm schedules than they reported last year and in most cases a smaller acreage of crops in cultivation. Counties whose reports were nearly

complete for both years, like Logan, Phillips and Weld, show but little change in cultivated acreage this year as compared with last year. No report whatsoever had been received from Rio Grande county at the time this Bulletin went to press and the reports for Jackson and Park counties were incomplete. The reports received last year from Rio Grande county were incomplete, so it is impossible to estimate what should be shown by the report this year. In the report from Jackson county published herein 75 farm schedules are included, while 260 schedules were included in the complete report last year. Park county has reported 247 schedules this year, compared with a complete report covering 290 schedules last year.

The blanks furnished county assessors for taking farm schedules this year were much more comprehensive than those furnished last year, and as a result acreage reports are given this year on many small crops that were not reported in 1919. This accounts for a part of the increase in cultivated acreage this year over that reported for last year. Present indications are that reports for the state as a whole are approximately 10 per cent of the actual acreage in cultivation, so that the cultivated area evidently is somewhat above 5,500,000 acres, perhaps close to 6,000,000 acres.

In the December Crop Bulletin revised figures on the acreage of all the principal crops, by counties, will be published, together with the total production of all the principal crops, also by counties. Before that time a careful study of all the acreage figures for the state as a whole will be made and such increases will be made in calculating the total acreage and production for the various crops as may be found to be necessary. In making the final estimates of production of crops last year a flat increase of 10 per cent was made in the assessor's figures for acreage of practically all crops. A partial study of the figures so far reported this year indicate that a somewhat larger increase should have been made in last year's acreage figures, and these will be revised later in the year, for purposes of accurate comparison. Lack of space makes it impossible to give detailed comparisons between the acreage figures for this year and last year, but those who are interested in making such comparisons may obtain copies of the August, 1919, Bulletin, in which the acreage figures for last year were published, by writing to the State Board of Immigration, State Capitol, Denver, Colo.

Estimates of production of the principal crops grown in the state this year, found on pages 15 and 16 of this Bulletin, are based upon preliminary acreage figures, and not upon the acreages reported by county assessors as found in other tables herein. The necessary revisions, which will be made in December, will apparently result in increases in the estimated production of winter wheat, corn, oats and barley, and decreases for spring wheat, rye, alfalfa and possibly potatoes.
