BULLETIN NO. 31 DECEMBER, 1921

Crop Report for Colorado

U. S. Department of Agriculture Bureau of Markets and Crop Estimates

H. C. Taylor, Chief

W. W. Putnam. Agricultural Statistician

In Cooperation with

Colorado State Board of Immigration

Division of Agricultural Statistics

Edward D. Foster, Commissioner

Howard D. Sullivan, Deputy

Final estimates made by the Colorado Co-operative Crop Reporting Service, based upon reports of county assessors, place the area of all crops harvested in Colorado in 1921, exclusive of orchards, at 5,947,345 acres, compared with a revised estimate of 5,828,805 acres harvested in 1920. The acreage cultivated in the state each year was considerably larger than the acreage harvested, as there is always some acreage abandoned, due to crop failure. The 1921 season was unfavorable in some sections of the state and the area abandoned was rather large, the area planted being somewhat more than 6,000,000 acres. The figures for 1921 have in most cases been corrected by adding 5 percent to assessor's figures because of incompleteness. Other methods were used, however, in estimating the acreage of the different varieties of hay, as it was apparent that assessors' reports were much more than 5 percent short of the true acreage devoted to nearly all hay crops. Acreage reports for 1920 have been corrected by adding 10 percent to assessors' figures, instead of the 12 percent used last year, as it now appears that assessors' reports for 1920 were somewhat more complete than they were first thought to be. Acreage figures for hay for 1920 are also arrived at by other methods, due to the greater percentage of incompleteness of assessors' figures for hay crops. It has not been thought advisable to make revisions by counties, for the reason that reports for some counties are much more complete than for others, some counties having reports more than 99 percent complete, while a few others were apparently less than 70 percent complete. Tables published elsewhere in this Bulletin give the total acreage reported by county assessors for all crops, by counties, and the production by counties for the principal crops. The general production table, published on page 2 of this Bulletin, gives the acreages as corrected by the methods outlined above, the total production based upon these acreages and the average yields as estimated by the Crop Reporting Service. and the value of each crop based upon prices prevailing on December 1 or at market time. In the case of some of the minor crops total production is not calculated, but the value of such crops is based upon the average return which growers obtain per acre. It will be noted that, for crops on which the production is calculated by counties, the total production found in these county tables differs from that found in the general table on page 2, for various reasons explained in the text relating to such crops.

Wheat-Reports of county assessors give a total of 1,408,260 acres devoted to winter wheat for the 1921 harvest, and 377,810 acres of spring wheat. The actual acreage of winter wheat planted in the fall of 1920 is estimated at 1,496,000 acres, and that of spring wheat planted in 1921 at 397,000 acres. The area of winter wheat harvested for grain is estimated at 1,346,000 acres and that of spring wheat at 373,000 acres. The 1921 season was very unfavorable in the northeast part of the state, where most of the winter wheat acreage is

^{*}The varieties of tame hay, with the estimated acreage of each variety for 1921, are as follows: Alfalfa, 774,000 acres; timothy, 45,000 acres; red clover, 5,000 acres; timothy and clover mixed, 124,000 acres; sweet clover, 12,000 acres; millet, 48,000 acres; other tame grasses, 21,000 acres; field peas, 10,000 acres; grains cut green, 138,000 acres; sudan grass, 17,000 acres; total, 1,194,000 acres.

[†]The estimated number of farm gardens is here given instead of the acreage. This figure is not included in total acreage. †This acreage is all accounted for in the acreage of sugar beets harvested and is not included in the total acreage figures.

found, the result being that a very considerable acreage of this crop was abandoned and the average yield for the entire state was estimated at but 12 bushels per acre, compared with 17.5 bushels for 1920. Average yields of all principal crops for 1919 as returned by the census bureau are found in a table elsewhere in this Bulletin. Logan, Sedgwick, Phillips, Washington and Yuma counties, all of which were affected by a severe drought in 1921, reported more than half the total winter wheat acreage reported for the state. The spring crop was not so much affected by drought as the winter crop, partly because spring wheat is not extensively grown in the area where drought prevailed and partly because spring wheat is grown more extensively under irrigation. Reports of assessors showed that only 7.96 percent of the winter wheat acreage was irrigated in 1921, while 48.32 percent of the spring wheat acreage was irrigated. The average yield of spring wheat is estimated at 19 bushels per acre, compared with 19.4 bushels in 1920. Attention has been called in previous issues of the Bulletin to the gradual decrease in the average yield per acre of many of the leading crops grown in the state, particularly small grains, due to the fact that there is a rather rapid increase from year to year of the acreage of such crops grown without irrigation, while the acreage grown under irrigation varies but little from year to year. The exceptionally low yield of winter wheat in 1921. however, is due more to unfavorable weather conditions in the principal winter wheat counties than to any other cause. The acreage devoted to wheat in the state in 1921 was by far the largest in the history of the state, due to a very large increase in winter wheat acreage in eastern and southeastern counties. These increases will be readily noted by comparison of the table giving the acreage and production of wheat by counties in this copy of the Bulletin with a similar table in the Bulletin for December, 1920. It will be noted that total production of wheat given in the county table is different from that given in the general table on page 2, for the reason that the county table is based upon the exact acreage reported by assessors for each county, while that in the general table is based upon the revised acreage given above.

It is estimated that 1,466,000 acres of winter wheat has been planted in the state this fall. The season has been very unfavorable for this crop, due to lack of moisture, and its condition on December 1 was estimated at only 76 percent of normal, compared with 87 percent last year and a ten-year average of 91 percent on December 1.

Corn-Reports of county assessors showed a total of 1.049,820 acres of corn for the state in 1921, compared with 1,074,814 acres reported in 1920. Revising assessors' figures by adding 5 percent for incompleteness gives a total of 1.102,000 acres of corn planted in 1921, of which it is estimated that \$88,000 acres was harvested for grain, the remainder being cut for silage, harvested for forage alone, fed in the field or abandoned. It is estimated that 55,000 acres was cut for silage, this being by far the most important silage crop grown in the state. The unfavorable season in the northeast counties reduced the production of corn heavily, these counties being large producers of corn as well as of winter wheat. The average yield is estimated at 14.5 bushels per acre, compared with 20.5 bushels in 1920. Corn now ranks second among the crops of the state in point of acreage. The slight decrease in acreage in 1921 was due chiefly to the large increase in acreage devoted to winter wheat, much acreage being devoted to this crop which otherwise would have been devoted to corn or to sorghum crops. The difference between the total production of corn found in the table on page 2 and that found in the county table is due to the fact that the entire acreage reported by assessors is considered as harvested for grain in the county table.

Oats—County assessors reported 275,001 acres of oats in the state in 1921, compared with 237,356 acres reported in 1920. Correcting the 1921 figures by adding 5 percent because of incompleteness, the total area devoted to oats is found to be approximately 289,000 acres. Special inquiries made by the Crop Reporting Service indicated that about 217,000 acres of this was harvested for grain, 52,000 acres cut green for hay and 20,000 acres pastured or abandoned. The average yield per acre is estimated at 31 bushels, which is slightly more than the average yield found by taking the averages given for the several counties, as published in the total production table for oats, found elsewhere in this Bulletin. The total production for the state given in this table will be

found to be different from that given in the general table on page 2, because the entire acreage was considered as harvested for grain in making up the county table. Reports of county assessors showed that 45.13 percent of the oats grown in the state in 1921 were irrigated, compared with 49.8 percent in 1920 and 69.7 percent in 1909.

Barley-County assessors reported 240,281 acres of barley in the state in 1921, compared with 266,714 acres reported in 1920. Revising the 1921 figure by the addition of 5 per cent on account of the incompleteness of assessors' returns, we have a total of approximately 252,000 acres devoted to the crop. Of this is it estimated that 202,000 acres was harvested for grain, 35,000 acres cut green for hay and 15,000 acres pastured or abandoned. The average yield is estimated at 22 bushels per acre, which is slightly more than the average yield found by taking the averages given for the several counties in the production table for barley, found elsewhere in this Bulletin. The total production found in this table is also somewhat different from the total production found in the general crop table on page 2, due to the fact that in the county table the entire acreage reported is regarded as if harvested for grain. Assessors' reports showed that 31.26 percent of the 1921 barley acreage was irrigated, compared with 33.2 percent in 1920 and 68.3 percent in 1909. There has been a very substantial increase in the acreage devoted to this crop in some of the nonirrigated districts east of the mountains, particularly in Kit Carson county, which reports a larger acreage of barley than any other county.

Rye—County assessors reported 127,116 acres of rye in the state in 1921, compared with 126,221 acres reported in 1920. Adding 5 percent to the 1921 figures because of incompleteness of reports, we have a total of 133,000 acres devoted to the crop in 1921. Of this it is estimated that 92,000 acres was harvested for grain, 21,000 acres cut green for hay and 20,000 acres pastured or abandoned. The average yield per acre was estimated at 11.5 bushels, compared with an average yield of 11.8 bushels in 1920. Assessors' reports showed 103,890 acres of fall rye and 23,226 acres of spring rye. Reports indicate that about 79,000 acres of fall rye has been sown in the state for the 1922 harvest.

Potatoes—Assessors' reports showed a total of 101,159 acres of potatoes in the state in 1921, compared with 69,311 acres reported in 1920. Making the necessary correction for incompleteness of returns, the total acreage devoted to potatoes in 1921 appears to have been about 106,000 acres. On account of unfavorable weather conditions in the non-irrigated districts and to damage done by frost in some of the important irrigated potato growing areas, it is estimated that only 90,000 acres of potatoes were harvested. The average yield per acre is estimated at 123 bushels, compared with an average of 130 bushels for 1920. The price of the 1921 potato crop was less disappointing to farmers than the prices of most other farm products, though hardly as high as was expected early in the season. The poor condition of the potato crop in other sections of the country indicated that rather high prices might be expected. Later reports indicated improved conditions in most potato growing states and the total production for the country was considerably higher than earlier estimates placed it, thus depressing prices slightly below those prevailing early in the season. Reports of county assessors showed that 76.57 percent of the potato acreage reported for 1921 was irrigated, compared with 73 per cent in 1920. The total production of potatoes given in the county table found elsewhere in this Bulletin is different from the total production given in the general production table on page 2, for the reason that in the county table the entire acreage reported is treated as harvested. Up to December 31, 1921, 8,237 cars of Colorester and the county table the entire acreage reported is treated as harvested. rado potatoes from the 1921 crop had moved by rail, compared with 7,662 cars to the same date in 1920. Total shipments from the 1920 crop were 11,334 cars, and indications are that the shipments from the 1921 crop will be some what larger than those for 1920, partly because of larger production in 1921 and partly because of more favorable prices.

Sorghums—County assessors' reports showed a total of 244,789 acres of grain sorghum, 80,121 acres of sweet sorghum and 16,011 acres of sudan grass in the state in 1921, compared with 266,714 acres of grain sorghum, 109,641 acres of sweet sorghum and 20,829 acres of sudan grass reported in 1920. This makes a total of 340,921 acres of sorghum crops reported for 1921, compared with 397,184 acres reported in 1920. Correcting the 1921 figures by the addition

of 5 percent for incompleteness and those of 1920 by adding 10 percent, we have 358,000 acres of sorghums for 1921, compared with 437,000 acres in 1920. In other words, there was a decrease of about 18 percent in the acreage devoted to sorghum crops in the state in 1920 compared with the previous year. decrease was due partly to the unfavorable conditions affecting the agricultural industry in all sections of the country and partly to the largely increased acreage of winter wheat in Colorado, some of the acreage that might otherwise have been devoted to sorghums being sown to winter wheat in the fall of 1920. There has been a steady increase in the acreage devoted to sorghums in Colorado for the past dozen years, 1921 being the first year to show a considerable decrease. It is estimated that 237,000 acres of the 1921 grain sorghum crop was harvested for grain or fed as a mixed forage and grain ration, the remainder being fed in the field or abandoned. The average yield of grain sorghum per acre is estimated at 16.5 bushels, compared with 17 bushels in 1920. Of the sweet sorghum crop it is estimated that 3,000 acres was cut for seed and the remainder cut for forage, fed in the field or abandoned. The entire acreage of sudan grass is cut for feed, being classed as a hay crop. Sorghums are grown almost wholly without irrigation and chiefly in eastern Colorado. They have proved to be excellently adapted to the soil and climate of eastern Colorado, making reasonably good yields of feed under the most exacting climatic conditions.

Beans-Reports of county assessors showed 43,618 acres of field beans (exclusive of seed and snap beans) in the state in 1921, compared with 56,548 acres reported in 1920. Correcting the 1921 figures by the addition of 5 percent we find that the area devoted to this crop in the state in 1921 was about 46,000 acres, the smallest since 1916. Prices received for beans have been somewhat unsatisfactory to growers for some years and acreage devoted to the crop has been decreasing since 1918. It is estimated that 38,000 acres of the 1921 crop was harvested for beans, the remainder being cut for forage or fed in the field. Pinto beans are grown much more extensively than any other variety of market beans in the state. There are also some navies, a few teparies and some miscellaneous varieties. Reports of assessors showed 2,784 acres of beans grown for seed in the state in 1921, which, corrected for incompleteness, gives about 3,100 acres. In former years the growing of seed beans has been an important industry in the state, particularly in the Greeley district and the Arkansas valley, but unsatisfactory prices and unfavorable conditions have reduced the production materially. The acreage in 1921 was greater than that for 1920 and the price received for the crop was in a general way more satisfactory to growers than the prices received for most general farm crops.

Broom Corn—Reports of county assessors showed 9,726 acres of broom corn in Colorado in 1921. Indications are that the report on this crop was not so complete as those for most other crops, and the total acreage is estimated at 12,000. The crop is grown chiefly in Baca and Prowers counties. There has been rather a sharp reduction in the acreage devoted to this crop in the state in recent years, due to unsatisfactory prices and market conditions. The average yield in 1921 was estimated at 400 pounds per acre, compared with an average of 370 pounds for 1920. Unfavorable prices prevailed during a part of the harvest season and it is believed some of the crop was not marketed.

Hay—If all varieties of crops used for hay are classed as a single crop, then hay has been for a good many years Colorado's leading crop in both acreage and value, and it still holds that distinction in value, though in acreage it is surpassed by wheat. The area devoted to all varieties of both tame and wild hay in the state in 1921 was 1,601,000 acres, compared with 1,719,000 acres devoted to wheat. The production of wheat was greatly reduced by unfavorable weather conditions which did not so adversely affect hay, and the total value of the wheat crop was \$17,661,640, compared with a value of \$19,743,060 for the entire hay crop. Hay can hardly be classed as a single crop, however, since it consists of alfalfa, timothy, clover, timothy and clover mixed, sudan grass, millet and some other tame grasses, a wide variety of wild grasses and a considerable acreage of small grains cut green and of such annual legumes as field peas and beans. Alfalfa is the most important hay crop, with 773,000 acres in 1921, which, with an average yield of 2.8 tons per acre, produced a total of 2,164,000 tons, worth, at prices prevailing on December 1, \$14,931,600. Other

varieties of tame hay with the acreage devoted to each are found in a note to the table on page 2, the total area devoted to all varieties of tame hay being 1,194,000 acres. The area devoted to wild hay is estimated at 407,000 acres, which produced an average yield of approximately one ton per acre.

Sugar Beets-Preliminary reports of the various sugar companies operating in the state show that 214,000 acres of sugar beets were planted in Colorado in 1921, compared with 253,600 acres planted in 1920. The acreage harvested in 1921 is estimated at 203,000 acres compared with 220,000 acres in 1920 The average yield per acre was approximately 11.23 tons, compared with 10.57 tons in 1920, and the average price per ton was about \$6.57, compared with \$11.88 in 1920. The total value of the 1921 sugar beet crop to formers, exclusive of beet tops, was about \$14,980,000, making this the second crop in point of value. if all varieties of hay are not classed as a single crop. Sugar beets also rank second among important crops in value per acre to the growers, being surpassed in this respect only by potatoes. If the entire production of beet tops in 1921 had found a market the sugar beet crop would undoubtedly have taken first rank in value, surpassing wheat. On account of the abundance and low prices of feed crops and the decrease in number of livestock fed a considerable part of the beet tops were not utilized. It is estimated that only 130,000 acres of beet tops found market, and these at the low average price of \$2.50 per acre, compared with about \$6 an acre in 1920.

Cabbage—Reports of county assessors showed 3,074 acres of cabbage in the state in 1921, compared with 3,998 acres reported last year. Of the 1921 crop 1,993 acres was reported as late cabbage and 1,081 acres as early cabbage. Assessors' reports were not quite so complete on cabbage as on the larger crops, and it is estimated that a total of 3,500 acres of cabbage was harvested in the state in 1921. The Colorado Cabbage Exchange, operating in the principal commercial cabbage territory in Adams, Weld and adjoining counties, marketed about half of the commercial cabbage, at an average price of a little more than \$1 per 100 pounds. The total production of cabbage for the season is estimated at about 38,500 tons, and the average price at \$24 a ton. The price for the 1920 crop was unsatisfactory and a large amount of cabbage was not marketed. It is estimated that there was a total of 4,400 acres in the state, of which only about 2,400 acres was harvested, with an average yield of 12.5 tons The average price received for the 1920 commercial crop was only about \$12 per ton. Total shipments of cabbage from the 1920 crop amounted to 1,672 cars, compared with 2,234 cars shipped up to December 31 from the 1921 crop.

Onions—County assessors reported 712 acres of onions for market in the state in 1921, including green onions, compared with 706 acres reported for 1920. The total acreage of dry and green onions in the state in 1921 is estimated at 765 acres, compared with 755 in 1920. The price for the 1920 crop was low and a considerable amount of the crop did not find a market. Shipments from the 1921 crop of dry onions up to December 31 amounted to 313 cars, compared with total shipments of 135 cars from the 1920 crop. It is estimated that growers realized an average of only about \$200 an acre in 1920 from both green and dry onions, compared with \$480 in 1921. Prices of dry onions in the commercial districts in 1920 were around 50 and 60 cents per bushel. The price on December 1, 1921, was \$1.80 per bushel.

Cantaloupes—County assessors reported 6,796 acres of cantaloupes in the state in 1921, exclusive of cantaloupes grown for seed. Reports on cantaloupes are not quite so complete as on most of the larger crops, and the area planted is estimated at 7,200 acres, compared with 7,800 acres in 1920. Cantaloupes for commercial purposes are grown almost exclusively in the Arkansas valley, Otero and Crowley counties reporting the bulk of the acreage. Some damage resulted to the crop from the floods in the valley in June, and considerable damage resulted later in the year from hail and other causes. Assessors also reported a considerable acreage of cantaloupes grown for seed in the state, the total being 965 acres, of which 822 acres were reported from Otero county.

Honey Dew Melons—Assessors reported 1,321 acres of honey dew melons in the state in 1921, compared with 991 acres reported in 1920. It is estimated that 1,300 acres of these melons were marketed in 1921, compared with about 1,000 acres marketed in 1920. These melons also are grown chiefly in Otero

and Crowley counties, where they have been increasing in popularity in recent years.

Celery—It is estimated that 500 acres of Colorado celery was marketed in 1921, at an average return to growers of about \$450 an acre, compared with 450 acres marketed in 1920, with an average return of about \$600 per acre. Celery is grown chiefly in the vicinity of Denver, though there is some production in Ell Paso, Pueblo, Fremont and Otero counties. This crop requires a large amount of labor and a considerable amount of skill to produce, but the return per acre is perhaps higher than for any other crop grown in the state. The quality of the late celery produced in the state in 1921 was not so good as usual, due to the continued warm weather throughout the fall and early winter.

Lettuce—The production of late head lettuce is getting to be an important industry in Colorado, the crop being grown chiefly in Chaffee, Custer, Fremont, Eagle and a few other counties, at altitudes generally above 7,000 feet. Quantity production of late head lettuce began in Chaffee county in 1920 and results obtained were very satisfactory. The total acreage of lettuce harvested in the state in 1920 was estimated at 450 acres, compared with 222 acres reported by the census bureau as harvested in 1919. County assessors reported 1,355 acres of lettuce in the state in 1921, and it is estimated that fully 1,400 acres was planted. The 1921 season was unfavorable for the crop, continued wet weather causing much of the lettuce to go to seed. It is estimated that the 1921 crop returned an average of only \$125 per acre for the acreage planted, compared with a return of \$300 an acre in 1920. Growers are by no means discouraged, however, and the acreage planned for 1922 is much larger than that grown in 1921.

Seed Crops—The production of seed crops in Colorado in 1921 was somewhat larger than that for 1920, but far below the high production reached in 1918, when more than 37,000 acres was devoted to the growing of vegetable seed, including sugar beet seed. The total acreage devoted to vegetable seed in 1921, including sugar beet seed and beans for seed, was close to 10,000 acres. Vegetable seeds are grown chiefly in the Greeley district and in the Arkansas valley, and the principal seed crops are cucumbers, beans, cantaloupes and onions. The area devoted to these seed crops in 1921 was somewhat larger than in 1920, and indications are that a gradual increase may be expected in the future until the state again takes the high rank it formerly held in the production of vegetable seeds.

Apples—The total production of apples in Colorado in 1921 is estimated at 3,200,000 bushels, compared with 2,830,000 bushels in 1920. Prices of practically all fruits grown in the state in 1921 were more satisfactory than the prices for staple farm crops, the average price of apples being estimated at \$1.70 a bushel, compared with \$1.40 a bushel in 1920. Up to December 31, 1921, 3,662 cars of apples of the 1921 crop had been forwarded, compared with 3,173 cars from the 1920 crop, and 3,070 cars the movement by rail from the 1919 crop. The shipments this season have been almost wholly from the Western Slope. The Eastern Slope crop was practically a failure, except in Larimer county where the crop was sold locally and transported by trucks. The quality of this year's crop was better than in 1920.

Peaches—The 1921 peach crop was estimated at \$60,000 bushels, compared with 670,000 bushels in 1920. The average price is estimated at \$1.75 a bushel, compared with \$2.50 for 1920. The peach shipments amounted to 1,286 cars this season compared with 997 cars for the season of 1920 and 1,373 cars the crop of 1919.

Pears—The production of pears in Colorado in 1921 is estimated at 483,000 bushels, compared with 386,000 bushels in 1920, and the price at \$2.20 a bushel, compared with \$1.90 in 1920. There was the largest movement of pears in the season of 1921 that has ever occurred in the history of the state, the shipments amounting to 805 cars, compared with 644 cars in 1920 and 575 cars in 1919. The quality of the crop was generally good.

Cherries—The 1921 cherry crop was about 60 percent of normal, compared with almost a total failure in 1920. Production is estimated at 3,600 tons, compared with 750 tons in 1920 and the average price was about 5.5 cents a pound, compared with 11 cents in 1920.

Orchard Fruits and Vines—According to the federal census the numbers of fruit trees and vines of bearing age in Colorado, on January 1, 1920, were as follows: Apples, 1,777,737; peaches, 446,943; pears, 136,117; plums and prunes, 80,027; cherries, 348,832; grape vines, 125,027; not of bearing age, apples, 183,315; peaches, 32,158; pears, 39,979; plums and prunes, 28,055; cherries, 74,799; grape vines, 15,836. From reports received there is apparently a gradual decrease going on in the number of apple trees of bearing age.

Small Fruits—According to the census, in 1920, there were 653 acres of strawberries, 600 acres of raspberries, and about 104 acres of blackberries, dewberries and loganberries in Colorado.

Live Stock-On page 36 of this Bulletin will be found a table showing the numbers of livestock of the different classes reported by county assessors for assessment purposes in 1921. It will be noted that a decrease is shown in all classes of livestock since 1920 except mules and dairy cattle, the increases in these two classes being very slight. The total number of horses reported is 334,095, compared with 337,903 in 1920; mules, 29,539, compared with 28,682 in 1920; range cattle, 1,123,462, compared with 1,187,480 in 1920; milch cov's, 143,990, compared with 143,981 in 1920; sheep, 855,973, compared with 915,394 in 1920; swine, 172,264, compared with 177,497 in 1920. It is generally conceded that the number of livestock reported by county assessors is considerably short of the actual number, many younger stock not being reported. There are also considerable numbers of cattle and sheep transferred from one section of the state to another or from other states to this state for feeding purposes, and assessed under what is known as a "fed in transit" rate, which is considerably below the actual value of the animals assessed, on the theory that the county in which the stock are fed is entitled to taxes only for that part of the year they remain in the feed lots. These are not included in the figures given above or in the table before referred to. The Co-operative Crop Reporting Service is making the usual inquiry regarding the number of livestock on farms in the state at the beginning of 1922, and the results will be published in the February number of this Bulletin.

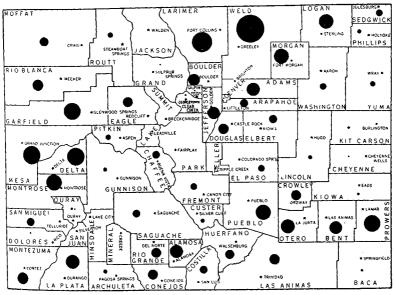

WAGES OF MALE FARM LABOR IN COLORADO

Per month— With Board\$ Without Board			\$55.50	\$51.00		\$32.50	\$30.60

Acreage Maps—A number of maps are published on subsequent pages of this Bulletin showing the relative acreages of various crops in the various counties of the state as reported by county assessors. The relative sizes of the circles in each individual map show the relative acreages in the various counties devoted to the crop which the map illustrates. The circles of different maps are not comparable as showing the relative acreages devoted to the different crops, as a circle of any given size does not represent the same acreage on all maps.

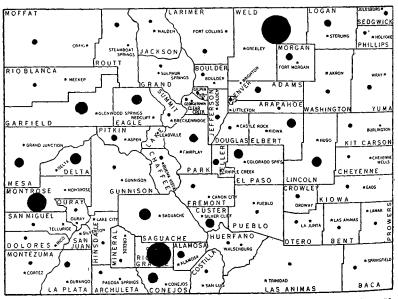

Colorado District Divisions as used in these reports.

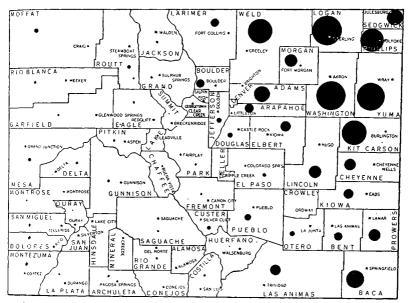

Alfalfa: Largest circle represents 89,000 acres. For other county acreages see page 19.

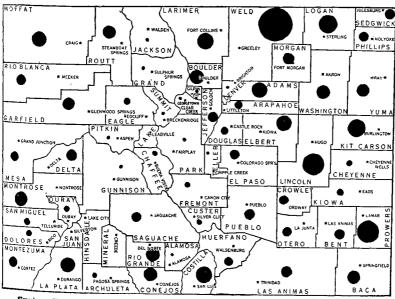

Corn: Largest circle represents 127,000 acres. For other county acreages see page 13.

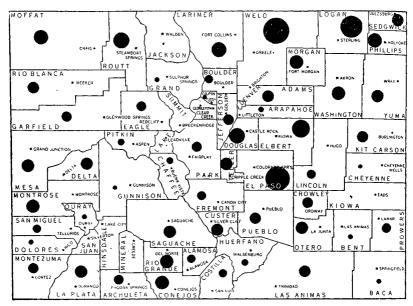

Potatoes: Largest circle represents 24,000 acres. For other county acreages see page 18.

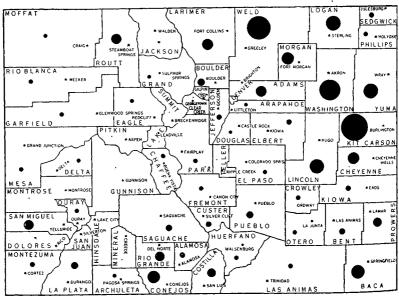

Winter Wheat: Largest circle represents 209,000 acres. For other county acreages see page 14.

Spring Wheat: Largest circle represents 59,000 acres. For other county acreages see page 15.

Oats: Largest circle represents 25,000 acres. For other county acreages see page 16.

Barley: Largest circle represents 41,000 acres. For other county acreages see page 17.
