TONS  
(THOUSANDS)

# THE COLORADO AGRICULTURAL INDUSTRY

Agriculture is the state's principal industry and as such brings more money into the state and provides employment for more people than any other. Employment is provided both in the producing and processing of agricultural products. Mining of gold, other metals, coal and the tourist trade make large contributions to the state's wealth and employment, but these are topped by agriculture. Cash received from the sale of Principal Farm Products and Government Payments totalled \$123,357,000 in 1936, compared with \$105,911,000 in 1935 and \$185,235,000 the high point of recent years attained in 1929.

The Colorado agricultural industry is a very interesting one; both from the large variety of crops grown and the extreme variation in conditions of climate and elevation under which they are grown. In addition to raising all of the staple crops such as wheat, corn, hay, etc., the state produces most of the principal truck crops in commercial quantities. These truck crops are shipped to many parts of the United States where they provide an important part of the country's fresh vegetable diet. These crops are grown mostly at elevations varying from 3,500 to over 8,000 feet above sea level.

Four principal tree fruits, apples, peaches, pears, and cherries are grown in commercial quantities. Colorado peaches and apples are distributed throughout the United States.

The three species of meat animals are raised in all parts of the state. Cattle and sheep graze at both low and high elevations and turn otherwise useless roughage into the valuable products of beef, lamb, and wool.

With approximately 3,400,000 acres, or 49 per cent of the total crop land, under irrigation, Colorado agriculture can always be counted upon to produce substantial quantities of food necessities. The hazard of production is materially lessened in the irrigated areas of the Platte Valley of Northern Colorado, the Arkansas Valley of the Southeast, the San Luis Valley of Southe-central Colorado, and the irrigated portions of the Western Slope and mountain areas.

## INVENTORY VALUE OF CROPS AND LIVESTOCK

The following explanation is offered in order that persons studying the Colorado agricultural industry may have some basis for distinguishing between **inventory values** as given in this publication and **farm income** also given.

For many years inventory values have been placed on crops in December of each year of production. These values are determined by multiplying the total quantity of each crop produced by the seasonal average farm price. The seasonal average prices used represent prices at the country station. The total inventory values do not, however, represent income from these crops, except in a few cases. Sugar beets are an example, and even with this crop, the total income is not represented when a value is placed on the beets alone, as the beet tops yield a certain income. Most crops result in farm income only as these crops are fed to livestock, and the livestock or their products are marketed. Hence, it would be definitely incorrect to use these crop inventory value figures as representing farm income in any way. For crops commonly referred to as "cash crops," such as sugar beets, potatoes, wheat, fruit, etc., there is a quite close relationship between inventory value and farm income from the marketing of these crops. Portions of crops not referred to as cash crops such as corn, oats, barley, and hay are sold for cash, and farm income results directly from these sales; but the proportion of these cash sales as related to total production in Colorado is relatively small. The difference, therefore, between cash income from these crops and the inventory value of them is large.

An inventory value has also been placed on livestock as of January 1 each year for many years. The value is computed by multiplying the number of animals on farms by the average farm price per head. These values do not, however, represent income from the livestock industry. Livestock produce farm income only when the animals are marketed, or when the livestock products such as wool, milk, cream, etc., are sold.

## FARM INCOME

There are so many considerations which enter into computations of any series of data dealing with farm income, that it is difficult through any brief explanation to make the major points entirely clear. A series of farm income figures is available on an annual basis for each year since 1924, which gives these data in two classifications: (1) "Gross" farm income, which includes cash received from the sale of crops, livestock, and livestock products, as well as the value of these commodities produced on the farm and consumed in the farm household on farms where the commodities were produced. (2) "Cash" farm income, which represents the amount of money received for quantities of crops, livestock, and livestock products actually sold off the farms where these were produced. This figure for each year is an aggregate one (which is also true of the gross farm income previously described), and no effort has been made to reduce these totals to a "net" income basis. The only expense item deducted in this series of figures is one representing the cost of livestock purchased at points outside the borders of the state and shipped into the state for feeding or addition to the breeding or dairy herds. None of the other expenses of farm production, such as interest, rentals, cost of machinery, and general "out of pocket" costs, have been deducted. Both of these series of data on farm income have been computed on a calendar year basis.

A series of farm income figures titled "Receipts from the Sale of Principal Farm Products and Government Payments" is available on a monthly basis beginning in January, 1929. This series of monthly income estimates is given in this publication. The series of annual estimates for the years 1924 to 1935, inclusive, is given in Colorado Agricultural Statistics, 1935.

The monthly estimates do not include the value of products produced on the farm and used in the family living, nor has the cost of livestock imported from points outside the state been deducted. Obviously, if the value of farm products used in the family living were added to this series, the totals would be somewhat higher. Whereas, if the cost of livestock importations were deducted, this monthly series of value figures would be reduced. Either or both of these procedures, if followed, would bring this monthly series summated for twelve calendar months into quite close agreement with the calendar year totals.

Many people using these data have experienced difficulty in understanding why they were not in agreement. This explanation is being offered with the thought that it may clarify some of the principal points in question. This entire series of farm income figures is now being revised, and we expect to publish these data in our 1937 booklet in such form that many of the complications inherent in the series now available will be eliminated.

## REVIEW OF THE 1936 CROP SEASON

The inventory value of principal crops produced in Colorado in 1936 was estimated at \$96,134,000, compared with \$62,693,000 for 1935 production. This large increase of 53 per cent becomes more significant when compared with the increase for the United States as a whole, which amounted to only 12 per cent. With a fairly favorable production season, Colorado producers were favored by short crops produced in the middle portion of the United States, which resulted in substantial price advances. Potato growers were the principal beneficiaries of this combination of circumstances. Favored with high acre yields and high prices resulting from the short United States crop, Colorado producers received a larger return for the 1936 potato crop than they had received for a good many years. Producers of corn, other feed grains and hay were also beneficiaries of short production elsewhere.

Colorado crops were harvested from 5,056,000 acres in 1936, which compared with 4,961,000 acres harvested in 1935. While lack of moisture and high summer temperatures levied a rather heavy toll on production in Eastern dry-land counties, even in some of these counties, higher prices largely offset the adverse effect of low yields. Yields in nearly all irrigated sections and other portions of the state were unusually good, and with high prices for most crops, the value of 1936 crops at \$96,134,000 reached the highest level in six years. Principal sections of agricultural prosperity in 1936 were Northern Colorado, the Arkansas and San Luis Valleys and most parts of the Western Slope section. Mountain Valleys produced good hay crops and much was exported dur-

ing the fall months and through the winter season following. Crops which contributed largely to the favorable showing made by Colorado agriculture in 1936 were potatoes, sugar beets, beans, fruit, wheat, corn and hay. The average yield per acre of principal crops was 95 per cent of the 1921-30, ten-year average yield. Yields obtained in 1935 were only 90 per cent of this ten-year average, while those of the drouth year, 1934, were only 61 per cent of this average.

Production of the four principal feed grains, corn, oats, barley, and grain sorghums was estimated at 24,038,000 bushels, compared with 22,655,000 bushels in 1935. While the supply of these grains was not abundant, most sections of the state had sufficient of these grains to carry breeding, dairy and work stock through the winter, and the cash corn section of Northeastern Colorado had some good corn for export.

**Wheat**—Despite adverse early spring and summer weather influences, wheat production totalled 10,691,000 bushels, which compared favorably with the small 1935 crop of 6,532,000 bushels. Production during the five-year period 1928-32 was 17,255,000 bushels. Acre yields in 1936 on the area harvested were about average, but abandonment of planted acreage was large. Irrigated yields were good. The 1936 crop was valued at \$10,595,000, which was nearly double the \$5,585,000 placed on 1935 production.

**Potatoes**—The crop averaged 185 bushels per acre and totalled 18,500,000 bushels. With the exception of the crop produced in 1922 and which totalled 19,040,000 bushels, this crop was the largest ever harvested in Colorado. It exceeded by 500,000 bushels the large crop of 1935 and compared very favorably with the 1928-32, five-year average crop of 14,584,000 bushels. The 1936 crop was valued at \$19,425,000, which was nearly three times the value of the record 1922 crop and more than double the value of \$9,540,000 for the 1935 crop. With the combination of large production and high prices, potatoes accounted for 20 per cent of the value of all crops in 1936. Colorado production was 23 per cent of the total potatoes produced by ten Western Surplus Producing states. The state was one of the nation's principal sources of potatoes during the 1936-37 marketing year.

**Sugar Beets**—Production was estimated at 2,234,000 tons, which compared with 1,826,000 tons harvested in 1935 and 2,525,000 tons the five-year average. The yield per acre averaged 13.1 tons and was slightly higher than the 1935 average, but an increase of 35,000 acres in the area harvested accounted principally for the increased tonnage. Colorado produced nearly one-fourth of the nation's sugar beets in 1936. The increased tonnage added employment during the winter following harvest.

**Beans**—Smaller 1936 plantings resulted in a bean crop of only 1,091,000 100-pound bags, compared with 1,174,000 bags produced in 1935 and 1,232,000 bags the five-year average. Higher prices, however, more than offset smaller production and the crop was valued at \$4,155,000, compared with \$3,003,000 for the 1935 crop. Yields were very good in irrigated sections and fair in dryland areas, even though abandonment was fairly large. Colorado along with New Mexico produces a large percentage of the nation's beans of the pinto variety.

**Corn**—Production of total corn was estimated at 11,169,000 bushels compared with 10,761,000 bushels produced in 1935 and 20,847,000 bushels the five-year average. Adverse weather influences and damage by grasshoppers held the 1936 total much below average, but high prices gave the crop a value of \$12,621,000, which compared with \$7,102,000 for the 1935 crop. The quantity of corn harvested for grain totalled 9,310,000 bushels, compared with 8,844,000 bushels so harvested in 1935.

**Oats and Barley**—The oats crop was estimated at 4,256,000 bushels, which compared with 4,480,000 bushels harvested in 1935, and 5,043,000 bushels the five-year average. The 1936 crop was valued at \$1,958,000, compared with \$1,523,000 for the 1935 crop. Irrigated yields were good, dryland yields low. Barley production was placed at 6,660,000 bushels, compared with 6,420,000 bushels harvested in 1935, and 9,635,000 bushels the five-year average. The 1936 crop was valued at \$4,729,000, compared with \$2,825,000 for the 1935 crop.

**All Tame Hay**—Production of all tame hay was estimated at 1,695,000 tons, compared with 1,712,000 tons produced in 1935, and 2,040,000 tons the five-year average. Production during the past several years was below the 1928-32 average, but as related to the number of hay-consuming animals, the supply produced in 1936 was fully ample to carry herds through the following winter.

in good condition. Exceptions maintained in parts of the Plains Section east of the Rocky Mountains, where dry weather resulted in small supplies. The 1936 crop was valued at \$13,899,000 against \$11,128,000 for the 1935 crop. Irrigated sections had a surplus of hay for export. Alfalfa production (included with all tame hay) totalled 1,279,000 tons in 1936, compared with 1,254,000 tons in 1935 and 1,483,000 tons the five-year average. As usual a considerable portion of the hay produced in the Arkansas Valley was sold to alfalfa mills, while that produced in the Northern Colorado section was fed within that territory. The Northern Colorado area fattened the largest number of cattle ever fed in that section during a single season. Lamb feeding was considerably reduced in that area.

## FRUIT

**Apples**—The 1936 apple crop of 2,050,000 bushels was the largest since 1932, and compared with 1,750,000 bushels harvested in 1935, and 2,051,000 bushels the 1928-32, five-year average. The relatively large crop produced in Colorado in 1936 was significant in view of the relatively large shortage in the nation's crop. The crop on the Western Slope was unusually good in 1936, but production has established a gradual down-trend. Principal producing sections in addition to the Western Slope area are the Larimer county section around Fort Collins, the Fremont county section around Canon City and the Denver and Boulder sections.

**Peaches**—Peach production in 1936 set another new record, with a crop of 1,345,000 bushels. This compared with the previous record of 1,280,000 bushels harvested in 1935, and 950,000 bushels the 1928-32 five-year average. Peaches are grown almost entirely in the Western Slope section, the principal concentration being on the Orchard Mesa adjacent to Palisade and Grand Junction. This restricted area produces around 80 per cent of the total crop. The balance of the commercial crop is produced largely in the Cedaredge-Paonia-Hotchkiss section of Delta county. These areas are unusually favorable for peach production and orchards are well cared for. Mosaic has been brought under control by removal of the infected trees. These removals have been fully offset by replacement and expansion plantings.

**Pears**—The 1936 pear crop of 220,000 bushels was below average and reflected the down-trend of the pear industry in recent years. Average production during the period 1928-32 was 340,000 bushels, while the crop of 1935 totalled 240,000 bushels. Commercial pears are produced largely in the Western Slope area. Many orchards have been abandoned and trees removed in recent years. The crop is becoming more and more in disfavor due to the need for frequent spraying to produce quality fruit. The general prevalence of blight is another factor contributing to the disfavor of this crop.

**Cherries**—The 1936 cherry crop was almost a total failure in the Fort Collins-Loveland area and in the Canon City section. Most of the short 1936 crop was produced on the Western Slope. Production was estimated at 700 tons in 1936, compared with 4,010 tons harvested in 1935, and 3,332 tons the five-year average.

## LIVESTOCK INVENTORY AND VALUE

The value of all livestock on Colorado farms January 1, 1937, was placed at \$90,978,000. This was an increase of \$2,220,000 or 2.5 per cent compared with a year earlier and an increase of \$35,912,000, or 65 per cent, compared with values January 1, 1935.

The January 1, 1937, valuation of all livestock at \$90,978,000 compares with \$88,758,000 on January 1, 1936; \$55,066,000, January 1, 1935; \$47,411,000, the low value of January 1, 1933, and \$130,281,000, January 1, 1930.

During 1936 the number of all cattle, milk cows, stock sheep, hogs, and mules increased; the number of horses declined slightly. There was a marked decrease in the number of sheep and lambs on feed.

**All Cattle**—The number of all cattle and calves was placed at 1,525,000 head on January 1, 1937, compared with 1,510,000 head, January 1, 1936. Inventory numbers reached the peak of recent years on January 1, 1934, with 1,773,000 head. The total value January 1, 1937, was \$49,411,000, compared with \$45,720,000 a year earlier. The value per head increased from \$30.30 to \$32.40 during 1936.

**Milk Cows**—The number of milk cows (included with all cattle) increased 2 per cent during 1936 and totalled 253,000 head on January 1, 1937, compared with 248,000 head January 1, 1936, and 270,000 head January 1, 1935. The Colorado dairy industry expanded gradually during the period 1925 through 1933. The number of milk cows reached a peak of 300,000 head, January 1, 1934, but declined sharply in 1934 and 1935. Present indications are that the industry is again expanding. The value of milk cows January 1, 1937, was \$11,638,000 against \$10,416,000 a year earlier. The value per head at \$46.00 was \$4.00 higher than on January 1, 1936.

**Sheep**—The number of stock sheep January 1, 1937, was placed at 1,687,000 head, compared with 1,654,000, January 1, 1936, an increase of 2 per cent. Stock sheep numbers reached a peak of 1,801,000 head in 1931 and declined irregularly after January 1, 1932. The increase during 1936 was the result of the larger 1936 lamb crop and increased imports. January 1, 1937, value totalled \$10,723,000 compared with \$11,196,000, January 1, 1936. Value per head declined from \$6.75 to \$6.35.

The number of sheep and lambs in feed lots January 1, 1937, at 1,030,000 head, was the smallest since 1927 and compares with 770,000 in that year and 1,250,000, January 1, 1936. The decrease during 1936 was almost entirely in Northern Colorado.

**Hogs**—The Colorado hog industry made substantial recovery during 1936. Numbers January 1, 1937, totalled 298,000 head, compared with 259,000 head, January 1, 1936. This was an increase of 15 per cent. January 1, 1937, numbers, however, were less than half the record number of 624,000 head, January 1, 1932. The January 1, 1937, inventory was valued at \$3,369,000 against \$3,452,000 a year earlier. Per head values declined from \$13.30 to \$11.31.

**Horses**—Horse numbers continued the decline which began in 1920. The number on January 1, 1937, totalled 259,000, compared with 264,000, January 1, 1936, and 278,000, January 1, 1935. The recent number, however, is only about two-thirds as large as the high number of 421,000 head on January 1, 1920. Values continued to rise and on January 1, 1937, averaged \$76.00 per head, compared with \$69.00, January 1, 1936. Inventory values totalled: 1937, \$19,623,000; 1936, \$18,286,000.

**Mules**—Mule numbers increased 1,000 head in 1936 and on January 1, 1937, totalled 18,000. On January 1, 1925, the number totalled 38,000 head. January 1 values per head and total values are as follows: 1937, \$93.00 and \$1,672,000; 1936, \$87.00 and \$1,479,000.

## LIVESTOCK FEEDING

Colorado leads the country as a producer of grain-finished lambs, and fattens annually about 25 per cent of the nation's total. The Northern Colorado section is advantageously located as related to the source of feeder lambs. Feeders can be obtained directly from ranges in Colorado and other Western sheep states, or from the Denver stockyards, which is the largest sheep and lamb market in the country. This market also provides adequate facilities for marketing the finished product. Colorado lamb feeders fatten from 1 to 1½ million lambs annually. The lamb feeding industry is a natural complement of the beet sugar industry. Feeding of these animals is the most advantageous means of utilizing the beet top and beet pulp, by-products of the growing and manufacture of sugar beets. Sugar beets are grown as a general cash crop in the four feeding areas of Northern Colorado, the Arkansas Valley, the Western Slope sections and the San Luis Valley of Southcentral Colorado. Locally raised feed grains and alfalfa provide most of the additional grain and hay needed for a balanced fattening ration.

Fattening of cattle in the four feeding sections, while done on a smaller scale than lamb feeding, is none the less an important part of the agricultural industry in these sections, particularly the Northern Colorado area. From 100,000 to 175,000 cattle are fattened in these sections annually.

F. K. REED,  
Agricultural Statistician.

## COLORADO CROP ACREAGE, PRODUCTION, AND VALUE, 1935

CROP	Acreage	Production		Unit	Farm Value†	
		Per Acre	Total		Per Unit	Total
Corn, All-----	1,266,000	8.5	10,761,000	Bu.	\$ .66	\$ 7,102,000
Oats for Grain-----	160,000	28.0	4,480,000	Bu.	.34	1,523,000

## ACREAGE, PRODUCTION AND VALUE OF DRY BEANS IN COLORADO, 1914-1936

Year	Acres		Production, 100 Lb. Bags	Price per Cwt.	Value	Value per Acre	
	Planted	Harv.					
1914	20,000	900	180,000	\$ 3.33	\$ 600,000	\$30.00	
1915	21,000	972	204,000	3.80	775,000	36.90	
1916	38,000	672	255,000	7.00	1,781,000	46.87	
1917	250,000	468	1,170,000	8.00	9,360,000	37.44	
1918	252,000	390	983,000	7.33	7,207,000	28.60	
1919	66,000	390	257,000	5.83	1,502,000	22.76	
1920	52,000	480	250,000	5.25	1,310,000	25.19	
1921	45,000	480	216,000	4.50	972,000	21.60	
1922	106,000	300	318,000	7.33	2,331,000	21.99	
1923	159,000	480	763,000	6.17	4,708,000	29.61	
1924	286,000	204	583,000	5.17	3,014,000	10.54	
1925	332,000	420	1,394,000	4.00	5,578,000	16.80	
1926	398,000	216	860,000	4.67	4,015,000	10.09	
1927	322,000	330	1,063,000	4.50	4,782,000	14.85	
1928	374,000	270	1,010,000	5.67	5,726,000	15.31	
1929	422,000	372,000	1,339,000	4.90	6,562,000	17.64	
1930	483,000	450,000	600	2,700,000	2.80	7,560,000	16.80
1931	468,000	351,000	258	906,000	1.40	1,268,000	3.61
1932	362,000	221,000	198	438,000	1.50	656,000	2.97
1933	462,000	365,000	330	1,204,000	2.65	3,192,000	8.74
1934	527,000	174,000	216	376,000	5.50	2,068,000	11.88
1935	530,000	435,000	270	1,174,000	2.75	3,003,000	6.90
1936	428,000	287,000	380	1,091,000	4.05	4,155,000	14.48

Note—The decline in average yield and value per acre is due almost wholly to the large acreage of non-irrigated land which has been devoted to this crop in recent years. More than 85 per cent of the crop is now produced without irrigation.
