COLORADO LEADS THE COUNTRY IN THE PRODUCTION OF SUGAR BEETS

THE COLORADO AGRICULTURAL INDUSTRY

Agriculture is the state's principal industry and as such brings more money into the state and provides employment for more people than any other. Employment is provided both in the producing and processing of agricultural products. Mining of gold, other metals, coal and the tourist trade make large contributions to the state's wealth and employment, but these are topped by agriculture. Cash received from the sale of Principal Farm Products and Government Payments totalled \$145,723,000 in 1937, compared with \$123,357,000 in 1936 and \$185,235,000, the high point of recent years, attained in 1929.

The Colorado agricultural industry is a very interesting one, both from the large variety of crops grown and the extreme variation in conditions of climate and elevation under which they are grown. In addition to raising all of the staple crops such as wheat, corn, hay, etc., the state produces most of the principal truck crops in commercial quantities. These truck crops are shipped to many parts of the United States where they provide an important part of the country's fresh vegetable diet. These crops are grown mostly at elevations varying from 3,500 to over 8,000 feet above sea level.

Four principal tree fruits, apples, peaches, pears, and cherries, are grown in commercial quantities. Colorado peaches and apples are distributed throughout the United States.

The three species of meat animals are raised in all parts of the state. Cattle and sheep graze at both low and high elevations and turn otherwise useless roughage into the valuable products of beef, lamb, and wool.

With approximately 3,400,000 acres, or 40 per cent of the total crop land, under irrigation, Colorado agriculture can always be counted upon to produce substantial quantities of food necessities. The hazard of production is materially lessened in the irrigated areas of the Platte Valley of Northern Colorado, the Arkansas Valley of the Southeast, the San Luis Valley of Southcentral Colorado, and the irrigated portions of the Western Slope and mountain areas.

REVIEW OF THE 1937 CROP SEASON

The inventory value of principal crops produced in Colorado during 1937 was placed at \$76,911,000 compared with \$99,255,000 for 1936 production. This was a decrease of a little over \$22,000,000, or 22 per cent. Although the value of crops produced during 1937 was lower than the value of those produced during 1936, receipts from farm marketings during the year were considerably higher. The value of crops and livestock marketed (including Government payments) during 1937 totalled about \$145,700,000, compared with \$123,400,000 for 1936 and \$106,000,000 for 1935. This increase in 1937 was due largely to the carry-over effect of crops produced in 1936 and marketed at favorable prices during the first half of 1937. Returns from livestock feeding and relatively large marketings of range livestock also swelled the 1937 cash returns and served to place the 1937 total at the highest level since 1930, when the state's agricultural industry grossed \$160,200,000.

The 1937 crop season despite a late spring was generally favorable for crop production to mid-July, with the result that acre yields of small grains were higher than in 1936 and slightly above average. Due to lack of natural moisture and some shortage of irrigation water, late maturing crops such as corn, sugar beets, potatoes and beans declined rapidly after August first and final acre yields were lower than those obtained in 1936, and below average.

The acreage of principal crops harvested in 1937 totalled 5,264,000 acres, compared with 5,081,000 acres harvested in 1936. The acreage of crops abandoned from all causes in 1937 was about 300,000 acres less than the acreage abandoned in 1936, but loss was above average. Abandonment of winter wheat was considerably smaller in 1937 than in 1936, while abandonment of corn and some other late maturing crops was larger.

Production of the four principal feed grains, corn (for grain), oats, barley and grain sorghums (for grain) totalled 19,317,000 bushels in 1937, compared with 21,140,000 bushels in 1936, and 33,570,000 bushels the 5-year (1928-32) average. This shortage made necessary the importation of more than the usual amount of these grains, particularly corn. Hay production in 1937 was about the same as in 1936, but supplies in the principal feeding areas were rather short.

The 1937 wheat crop of 15,155,000 bushels was the largest since 1931, and was nearly 50 per cent larger than the 1936 crop of 10,691,000 bushels. The production of other principal cash crops such as sugar beets, potatoes, and beans was lower than in 1936.

Potatoes—Production was estimated at 15,688,000 bushels, compared with 18,500,000 bushels, the large crop of 1936, and 14,584,000 bushels the 5-year (1928-32) average. The 1937 crop was valued at only \$7,060,000, compared with \$20,535,000 for the 1936 crop, which moved at high prices. Production in 1937 was very promising to August 1, but prospects declined thereafter due to shortage of irrigation water and sub-normal rainfall. Yield per acre averaged 148 bushels against 185 bushels in 1936.

Sugar Beets—Due to smaller plantings and a yield of only 12.4 tons per acre, production declined to 1,992,000 tons, compared with 2,234,000 tons in 1936, and 2,525,000 tons, the 5-year average. The late spring, leaf spot and insufficient late water resulted in sugar content lower than that of several years preceding.

Beans—Smaller plantings and adverse late summer weather curtailed production to 781,000 bags, compared with 1,091,000 bags in 1936, and 1,232,000 bags the 5-year average. Prices were also lower and the 1937 crop was valued at \$2,702,000, compared with \$4,855,000 for the 1936 crop.

Corn—Production of corn harvested for all purposes was placed at 8,536,000 bushels, compared with 11,169,000 bushels in 1936, and 20,847,000 bushels the 5-year average. These estimates include the grain equivalent of corn harvested for silage and fodder as well as corn harvested for grain. The price per bushel was about half that of a year earlier, and the entire 1937 crop was inventoried at only \$5,378,000, compared with \$12,286,000 for the 1936 crop. Due to lack of moisture and high temperatures the crop declined greatly after August first. The quantity of corn harvested for grain was estimated at 5,760,000 bushels against 9,310,000 bushels harvested in 1936. Little 1937 Colorado corn was available for export.

Wheat—The 1937 crop of 15,155,000 bushels was nearly 50 per cent larger than the 1936 crop of 10,691,000 bushels. The increase was entirely in winter wheat. The 1937 crop was valued at \$13,848,000, compared with \$10,702,000 for the 1936 crop.

Oats and Barley—Oats production was estimated at 4,433,000 bushels against 4,256,000 bushels in 1936. Yield per acre at 31 bushels was the highest in recent years. Barley production totalled 8,772,000 bushels compared with 7,122,000 bushels in 1936. The inventory value of these two crops was \$6,159,000 for 1937 and \$7,213,000 for 1936.

Sorghums—Production of grain sorghums for all purposes was placed at 1,521,000 bushels, compared with 1,953,000 bushels in 1936, and 2,253,000 bushels the 5-year average. Sweet sorghums produced 148,000 tons of forage in 1937 against 140,000 tons in 1936. Values were low.

All Tame Hay—Production totalled 1,661,000 tons, compared with 1,695,000 tons in 1936, and 2,040,000 tons the 5-year average. The 1937 crop was valued at \$12,966,000 against \$13,899,000 for the 1936 crop. **Alfalfa** production (included with all tame hay) totalled 1,240,000 tons, compared with 1,279,000 tons in 1936, and 1,483,000 tons the 5-year average. The crop was short in the northern Colorado area, but generally sufficient in other alfalfa growing sections.

Wild Hay—The wild hay crop was estimated at 356,000 tons, compared with 319,000 tons in 1936, and 334,000 tons, the 5-year average.

Broomcorn—During the period 1927 to 1932 Colorado ranked high among the states as a producer of broomcorn. In 1930 the state produced 10,400 tons. Baca county, located in the far southeastern corner of the state, is the principal producer. Rainfall and growing conditions have been very unfavorable in that area in recent years, and broomcorn crops have been small. In 1937 only 2,100 tons were produced. This was the smallest crop since 1925. The yield per acre harvested was low and abandonment of planted acreage large. Most of the broomcorn grown in Colorado is of the dwarf variety.

Field Peas—This crop is grown primarily in the San Luis Valley. The acreage has declined steadily in recent years. The acreage harvested in 1937 at 29,000 acres was 20,000 acres below the 1929 area. Production in 1937 was estimated at 290,000 bushels. In a number of earlier years production exceeded one-half million bushels. A substantial portion of the acreage is grazed in the field by livestock. The percentage harvested for threshing grain has declined in recent years.

FRUIT

Apples—Apples produced in Colorado are of excellent quality, flavor and color. The commercial industry is concentrated in a few counties. Delta county on the Western Slope has nearly one-half the apple trees in the state. Fremont county ranks second in number of trees, but many of the orchards in this county are small and some have been badly neglected. Mesa county, also on the Western Slope, is third in number of trees and produces many commercial apples. Larimer county in Northern Colorado is also important in the production of commercial apples from orchards in the vicinity of Fort Collins. Other counties important in apple production are Montezuma and Montrose in Western Colorado, and Boulder and Jefferson north and west of Denver.

The 1937 apple crop was small in most parts of the state. The crop in Delta county was very short. Production for the state as a whole totalled only 1,457,000 bushels, compared with 2,050,000 bushels, the relatively large crop of 1936, and 1,968,000 bushels, the 10-year (1927-36) average.

Peaches—The peach industry in Colorado is rather unique in that the orchards are concentrated in two distinct areas, and the fact that the entire crop moves to market in the short period of approximately six weeks, in August and September. During this time Colorado peaches dominate the market supply in many consuming centers throughout the country.

Fully two-thirds of the trees are located in Mesa county of Western Colorado. In this county most of the trees are located on the Orchard Mesa near Palisade and Grand Junction. The balance of the commercial crop is grown in Delta county in areas near the towns of Cedaredge, Paonia, and Hotchkiss. Climate, soil, and air-drainage are favorable for peach production in all these sections, and water for irrigation is abundant. In recent years many trees infected with mosaic have been removed, but these removals have been more than offset by replacement plantings and plantings of additional new orchards. Production appears to be on the up-trend, as new trees are coming in to bearing each year.

The 1937 crop again set a new high record of production with 1,533,000 bushels. Prior to 1937 the crop of 1936 at 1,345,000 bushels was the largest ever produced. During the ten-year period, 1927 to 1936, production averaged only 1,013,000 bushels, hence the 1937 crop was fifty per cent above average.

Pears—This fruit crop was much more important in Colorado during the period from 1920 to 1929, when crops of between 500,000 and 600,000 bushels were produced. In recent years many orchards have been pulled and production has ranged between 200,000 and 300,000 bushels. Disease, principally blight, low prices, and the necessity for frequent spraying have been the principal causes of the decline of this crop.

Production of pears in 1937 totalled only 153,000 bushels, compared with 220,000 bushels in 1936 and 307,000 bushels, the 10-year average.

Cherries—Cherries produced in Colorado are mostly of the sour variety, although some sweet cherries are produced on the Western Slope, in Mesa and Delta counties. Many Colorado cherries are canned at plants located in Loveland, Fort Collins (near), Canon City, Grand Junction, and Delta.

Larimer county ordinarily produces nearly two-thirds of the state's cherry crop, followed by Fremont, Mesa, Jefferson, and Delta counties in order of importance.

Production in 1937 totalled 3,460 tons, which was in sharp contrast with the short 1936 crop of only 700 tons. Production during the 10 years, 1927 to 1936, averaged 3,300 tons.

Grapes, Apricots, Plums—**Grapes** are grown primarily in Mesa, Delta, Fremont, and Garfield counties, and also in the area tributary to Denver. In 1937, 570 tons of grapes were harvested, compared with 600 tons in 1936 and 477 tons the ten-year average. **Plums** are also grown in these counties, but on a relatively small scale. **Apricots** are grown in the same two counties which produce peaches on a commercial scale.

Strawberries, Raspberries—These two berry crops and other berries are grown primarily in Jefferson county and in other areas tributary to Denver. A portion of these fine quality berries is shipped to outside markets, but the bulk of them go to supply the Denver market. These small fruits are also produced in some volume in Larimer, Garfield, Fremont, Mesa, and Delta counties.

TRUCK CROPS (Commercial Vegetables)

Colorado vegetables are known throughout the country for their fine quality and flavor. The industry is an important one as related to the amount of labor employed, the gross value of the crop produced, and the high value per acre.

In 1937, 56,490 acres were devoted to commercial vegetables worth \$7,612,000. In 1936, only 53,720 acres were harvested, but the crop was worth \$6,930,000. These crops are grown almost entirely in the irrigated areas, although some crops such as lettuce and spinach are grown in the northwest and mountain areas without irrigation.

The rank of truck crops in relation to the acreage devoted to each of them is as follows: Green peas, cantaloupes, and honey-dew melons, cabbage, tomatoes, lettuce, onions (dry), snap beans, cauliflower, spinach, celery, and carrots. Other vegetables, such as broccoli, egg plant, peppers, turnips, radishes, green onions, in fact practically all of the common garden vegetables, are grown somewhere in Colorado. The quantity of these vegetables in the second group is rather small and most of them are consumed locally, but parts of these crops reach markets outside the state through truck or express shipments.

Cantaloupes and Honey-Dew Melons—This crop is a very important one in the Arkansas Valley, where shipments supply a large percentage of the nation's total consumption during the months of August and September. "Rocky Ford" cantaloupes have been long known for their splendid flavor. Recently a large part of the acreage has been planted to "Resistant 45's", which permits vine ripening without reducing shipping quality. Many cars are now being "pre-cooled" before shipment and this, together with vine ripening is placing Colorado cantaloupes on consumer tables with even better quality and flavor than formerly.

The proportion of honey-dew melons has increased greatly in recent years and a substantial percentage of these melons is also vine ripened and pre-cooled before shipment. In most years quality and flavor is excellent. Consumers may look forward to an even better product in the future. Colorado vine-ripened honey-dews are a real treat.

Counties which lead in production are Crowley, Otero, Pueblo, Adams, Weld and Mesa.

Green Peas—This crop is grown to supply both the canning and fresh vegetable market. A goodly portion of the peas grown in Northern Colorado, in the Canon City area, and in the San Luis Valley is canned each year, but the fresh crop from these areas is widely distributed. In 1937, 11,400 acres were grown for the fresh vegetable market, and 3,690 acres were grown for canning. The total crop was valued at \$819,000. Principal producing counties are Conejos, Costilla, and Custer, where the bulk of the crop is shipped fresh. Production in Boulder and Larimer counties is largely canned.

Cabbage—Cabbage of the Early Domestic type supplies the summer market, beginning in July, while the Late Danish types supply the fall and winter markets. The bulk of the crop is produced in Weld, Adams, and Costilla counties. A small quantity is canned as kraut each year. The 1937 crop of all cabbage was grown on 5,220 acres and was valued at \$582,000. Quality and flavor of Colorado cabbage are excellent.

Cauliflower—The bulk of this crop is grown in Costilla county in the San Luis Valley, and at an elevation of 7,500 feet above sea level. This county is one of the leading counties in the United States in the production of cauliflower. Pueblo, Adams, Fremont and Custer counties also grow this crop in considerable volume. In 1937, 2,720 acres of cauliflower were harvested, but due to low prices the crop grossed only \$359,000.

Tomatoes—About two-thirds of the acreage is grown for canning, either as juice or fruit. The crop grown in the Arkansas Valley is canned extensively, which is also true of the crop grown in Weld and Adams counties. Harvest begins in August and continues until frost. Due to abundant sunshine and the varieties grown, these tomatoes produce an unusually fine pack. Fresh tomatoes trucked and shipped by rail from Colorado are a pleasing product in the consuming markets.

In 1937, 7,100 acres of tomatoes were grown, of which 4,700 were grown for manufacture and 2,400 acres were grown for the fresh vegetable market. The total crop was valued at \$651,000.

Celery—Colorado giant and short strain Pascal celery is probably the most talked of and highly praised vegetable product. A large percentage of the crop is grown immediately north and west of Denver in Jefferson and Adams counties. Minor producing areas are in the vicinity of Canon City and just east of Pueblo. Small quantities are also grown in Otero county and in several counties on the Western Slope.

A large percentage of Colorado celery is wrapped with paper for bleaching in the field and is then placed in trenches for further bleaching and storing for the Thanksgiving and Christmas markets. Trenched celery has a quality and flavor not exceeded anywhere. In recent years much Colorado celery has been shipped in individual gift packages during the Holiday season. Only a small portion of the crop moves in carloads, but shipments by express go to all parts of the country and additional quantities move by truck. In 1937, 1,200 acres of celery were harvested, compared with 1,300 acres in 1936. Production in 1937 totalled 324,000 crates, worth \$616,000. While the cost per acre of producing celery is large, the average value of the crop per acre is the highest for any crop grown in the state. In some years the value per acre has exceeded \$500.

LIVESTOCK INVENTORY AND VALUE

The value of all livestock (excluding poultry) on Colorado farms January 1, 1938, was placed at \$87,756,000. This was a decrease of \$4,656,000, or 5.0 per cent, compared with values January 1, 1937, and a decrease of \$1,002,000, or 1.0 per cent, compared with values January 1, 1936.

The value of all livestock January 1, 1938, at \$87,756,000 compared with \$92,412,000 a year earlier, \$88,756,000 January 1, 1936, \$47,411,000 the low value January 1, 1933, and \$130,281,000 January 1, 1930.

During the year 1937 the number of horses, mules, all cattle, milk cows, stock sheep, and hogs decreased. There was an increase of 16 per cent in the number of sheep and lambs on feed. The average value per head of each species of animals was lower on January 1, 1938, than a year earlier.

All Cattle—The number of all cattle and calves was placed at 1,554,000 head, compared with 1,570,000 head January 1, 1936, a decrease of 1 per cent. The total value January 1, 1938, was \$48,987,000, compared with \$50,579,000 a year earlier. The value per head decreased from \$32.20 to \$31.50 during 1937. Cattle numbers in Colorado reached the peak of recent years on January 1, 1934, with 1,773,000 head.

Milk Cows—The number of milk cows (included with all cattle) decreased 3 per cent during 1937, and on January 1, 1938, totalled 245,000 head, compared with 253,000 head January 1, 1937, and 248,000 January 1, 1936. On January 1, 1934, Colorado farmers had 300,000 milk cows. Milk cows were valued at \$11,270,000 January 1, 1938, compared with \$11,638,000 January 1, 1937, value per head at \$46.00 being the same on both dates. •

Sheep—The number of stock sheep was placed at 1,720,000 head, compared with 1,737,000 January 1, 1937. Ewes were marketed in greater numbers in 1937 than in 1936, and fewer ewe lambs were held. The number of sheep and lambs in feed lots January 1, 1938, totalled 1,185,000 head, an increase of 15 per cent, compared with the small number on feed January 1, 1937, of 1,030,000 head, and 1,250,000 January 1, 1936. The total sheep and lamb inventory was valued at \$17,741,000 on January 1, 1938, compared with \$17,216,000 January 1, 1937. Value per head was \$6.10 on January 1, 1938, and \$6.20 January 1, 1937.

Hogs—The Colorado hog industry lost during 1937 all of the gain made in 1936. The inventory number January 1, 1938, totalled 253,000 head, against 298,000 January 1, 1937, and 259,000 January 1, 1936. Values January 1, 1938, were sharply lower than a year earlier, being \$2,485,000 and \$3,369,000 respectively. The value per head January 1, 1938, averaged \$9.80 against \$11.30 January 1, 1937.

Horses—Horse numbers continued to decline during 1937. The number January 1, 1938, was 254,000 head compared with 259,000 a year earlier. In 1920, Colorado farmers had 421,000 horses. The value per head and total value of horses was lower on January 1, 1938, than on January 1, 1937, the comparison being \$68.00, \$76.00; and \$17,178,000, \$19,623,000.

Mules—The number of mules in Colorado has always been relatively small. January 1, 1938, numbers totalled 16,000 head against 17,000 January 1, 1937. Values January 1, 1938, and 1937 were \$1,365,000 and \$1,625,000. Per head values were also lower.

Lamb Crop—The number of lambs docked or saved in 1937 was estimated at 1,250,000 head, compared with 1,243,000 head saved in 1936. In 1934 the lamb crop totalled 1,270,000 head, which was the largest of record. Beginning with 1929, lamb crops have exceeded one million head each year. In 1937 a total of 87 lambs were saved for every 100 ewes one year old and over on hand at the beginning of the year. This lambing percentage was relatively large and reflected the good condition in which ewes came through the winter and the favorable weather at lambing time.

Wool—The 1937 wool clip totalled 13,243,000 pounds, and was the third largest of record. In 1936, 13,062,000 pounds of wool were shorn, while the record clip of 1931 totalled 13,541,000 pounds. Prices received for the 1937 clip averaged 32 cents per pound, and were the highest since 1928, when the average was 33 cents per pound. The 1937 price was sharply higher than the price of 26 cents received for the 1936 clip, and striking as related to the 7 cents per pound received for the clip of 1932. The total value of the 1937 wool clip was \$4,238,000, compared with \$3,396,000 for the 1936 clip, and \$862,000, the low value for the 1932 clip.

Calf Crop—In most years the number of calves born in Colorado totals slightly over one-half million head. The number born in 1937 was estimated at 539,000 head. In the years 1933 and 1934 the number exceeded 600,000 head. These estimates include dairy calves as well as beef calves born under farm and range conditions.

Pig Crop—The number of pigs saved from both spring and fall litters in 1937 was estimated at 326,000 head. This was less than two-fifths the number saved in 1931, when hog production reached the peak of recent years with 785,000 pigs saved. The 1937 level of hog production was below a desirable minimum. However, this condition was largely forced upon Eastern Colorado farmers by short feed supplies, which forced breeding stock to market. Colorado is rather favorably located as related to market outlets for hogs. In addition to the local demand and the demand of the Denver Stockyards market, hogs can be shipped to the Pacific Coast at a good price advantage. Frequently, in recent years, prices on the Denver market have equalled or exceeded prices paid at Omaha, Kansas City and other Missouri River markets.

Chickens—Colorado leads the states in the Rocky Mountain region in the production of chickens and eggs. Of the eleven states located west of the one hundred second meridian, only California and Washington exceed Colorado in production. A large percentage of the chickens and eggs produced in Colorado are produced by flocks of less than 400 hens and pullets, which are a complement to general farm operations. There are, however, approximately 200 commercial flocks in the state having in excess of 1,000 birds each.

There were 3,390,000 chickens on farms January 1, 1938, and 5,092,000 chickens were raised during 1937. Egg production in 1937 was estimated at 318 million. Chickens on farms January 1, 1938, were inventoried at \$2,034,000, while chickens and eggs produced during 1937 were valued at \$2,953,000 and \$5,380,000 respectively. It is obvious from the size of these figures that the chicken industry in Colorado is a desirable complement to the farm enterprise, both as related to the farm family living, as well as a provider of ready cash.

Turkeys—The number of turkeys raised annually usually totals between 500,000 and 600,000 birds. During 1937, production was curtailed to 460,000 birds, following the low prices received for the 1936 turkey crop. These birds are produced by many experienced growers, who raise them on a commercial scale, although a good many birds are raised in small farm flocks.

A large percentage of Colorado turkeys are of good quality and are marketed as dressed birds. Climate is favorable for the turkey industry. Turkeys are raised in nearly all counties in the state, but are grown commercially primarily in Larimer, Weld, Jefferson, Morgan, Adams, Washington and Yuma counties of Northern Colorado and in Otero and Prowers counties in the southeast. Turkeys are also raised commercially on the Western Slope, where Delta, Montrose and La Plata counties lead.

LIVESTOCK FEEDING

Colorado leads the country as a producer of grain-finished lambs, and fattens annually about 25 per cent of the nation's total. The Northern Colorado section is advantageously located as related to the source of feeder lambs. Feeders can be obtained directly from ranges in Colorado and other Western sheep states, or from the Denver stockyards, which is the largest sheep and lamb market in the country. This market also provides adequate facilities for marketing the finished product. Colorado lamb feeders fatten from 1 to 1½ million lambs annually. The lamb feeding industry is a natural complement of the beet sugar industry. Feeding of these animals is the most advantageous means of utilizing the beet top and beet pulp, by-products of the growing and manufacture of sugar beets. Sugar beets are grown as a general cash crop in the four feeding areas of Northern Colorado, the Arkansas Valley, the Western Slope sections and the San Luis Valley of Southcentral Colorado. Locally raised feed grains and alfalfa provide most of the additional grain and hay needed for a balanced fattening ration. (See page 121.)

Fattening of cattle in the four feeding sections, while done on a smaller scale than lamb feeding, is none the less an important part of the agricultural industry in these sections, particularly the Northern Colorado area. From 100,000 to 175,000 cattle are fattened in these sections annually. (See page 122.)

F. K. REED,
Agricultural Statistician.

COLORADO CROP ACREAGE, PRODUCTION, AND VALUE, 1936

1925		332,000	420	1,394,000	4.00	5,578,000	16.80
1926		398,000	216	860,000	4.67	4,015,000	10.09
1927		322,000	330	1,063,000	4.50	4,782,000	14.85
1928		374,000	270	1,010,000	5.67	5,726,000	15.31
1929	422,000	372,000	360	1,339,000	4.90	6,562,000	17.64
1930	483,000	450,000	600	2,700,000	2.80	7,560,000	16.80
1931	468,000	351,000	258	906,000	1.40	1,268,000	3.61
1932	362,000	221,000	198	438,000	1.50	656,000	2.97
1933	462,000	365,000	330	1,204,000	2.65	3,192,000	8.74
1934	527,000	174,000	216	376,000	5.50	2,068,000	11.88
1935	543,000	425,000	270	1,174,000	2.75	3,003,000	6.90
1936	428,000	287,000	380	1,091,000	4.45	4,855,000	16.92
1937	391,000	244,000	320	781,000	3.65	2,851,000	11.68

Note—The decline in average yield and value per acre is due almost wholly to the large acreage of non-irrigated land which has been devoted to this crop in recent years. More than 85 per cent of the crop is now produced without irrigation.
