TOTAL CROP LAND (1935 FEDERAL CENSUS)—ACRES HARVESTED, FAILURE, IDLE AND FALLOW IN 1934)

Each dot represents 5,000 acres

PRINCIPAL CROPS, HAY BY KINDS, ACRES HARVESTED, 1924-1938

* INCLUDES SWEET CLOVER, MILLET, HERSEY, SUDAN, ETC. CUT FOR HAY

REVIEW OF THE 1938 CROP SEASON

The aggregate production of field crops in 1938 was much higher than production in 1937, and larger than that of several years preceding. Crops which made good production records during the year were wheat, oats, barley, and beans. Production of each of these crops was the largest since 1930. Production of hay was also the largest since 1930, and in addition an unusually good supply of rough feed was produced in the Eastern Plains area, where feed supplies had been short or in very limited supply for several years. The grain sorghum crop was the largest since 1923, and one of the largest crops ever grown in the state. The 1938 corn crop, although larger than the crop of 1937, and the largest since 1933, was not particularly good. Good fruit crops were harvested. The peach crop was the largest ever produced in Colorado.

The 1938 season started with a favorable early spring, and ended with frost dates later than usual. The supply of irrigation water was adequate throughout the season, and much water was stored for use in 1939. The supply of moisture in non-irrigated sections was good early, but deficient during parts of July and August. Harvest weather was very favorable in October and November, except in some of the lower western valleys. In general the 1938 season was one of good yields per acre and comparatively low abandonment. Only 14 per cent of the acreage of all crops planted was abandoned, while in 1937, 24 per cent was abandoned. The acreage of all field crops harvested totalled 5,941,000 acres compared with 5,193,000 acres in 1937, and was the largest since 1932. Production of the four principal feed grains, corn (for grain), oats, barley, and sorghums (for grain) totalled 27,752,000 against 19,317,000 bushels in 1937.

Not all aspects of the 1938 season were favorable. Potatoes promised well early, but yield performance was poor due to the effect of one of the worst infestations of psyllid in years. Disease also reduced yields and caused considerable loss of potatoes in storage. Sugar beets established a new record yield per acre of 14.6 tons, but the gross tonnage was held in check by the smallest acreage since 1925. The quality of beans was impaired by heavy September rainfall, which caused considerable discoloration and splitting. Prices received by farmers for most crops in 1938 approximated the low level of 1933, and more than offset the large production volume in the inventory value. The inventory value of all principal crops produced in 1938 was estimated at \$66,393,000 compared with \$75,411,000 for 1937, \$99,255,000 for 1936, and the low level of \$41,308,000 for 1932 crops. The gross cash farm income for the calendar year 1938 (including Government payments) was estimated at \$115,017,000, compared with \$145,723,000 in 1937, a decrease of over \$30,000,000 or 21 per cent.

Potatoes—Production was estimated at 11,830,000 bushels, compared with 15,688,000 bushels harvested in 1937, and 14,827,000 bushels, the 10-year (1927-36) average. The crop promised well early, but deteriorated greatly later in the season due to damage by insects and disease. The 1938 crop was inventoried at \$6,625,000 against \$7,060,000 for the 1937 crop. The yield per acre averaged 130 bushels against 148 bushels for both 1937 and the 10-year average. The percentage of the crop that was of merchantable quality was the lowest in a number of years.

Sugar Beets—A record high yield of 14.6 tons per acre was made in 1938, but production totalled only 2,001,000 tons, compared with 1,992,000 tons in 1937, and 2,366,000 tons, the 10-year average. The planted acreage was reduced to 141,000 acres, and was materially smaller than plantings in 1937. The acreage harvested at 137,000 acres was the smallest since 1925. The good supply of irrigation water combined with a favorable growing season accounted for the high average yield per acre.

Beans—The late frost, fair to good growing weather, and the larger acreage grown under irrigation resulted in a bean crop of 1,406,000 100-lb. bags, which compared with 781,000 bags in 1937 and 1,107,000 bags the 10-year average, and was the largest crop since 1930. Quality of the crop was reduced by heavy September rains, but the yield per acre averaged also the highest since 1930. The inventory value of the crop was estimated at \$4,270,000, compared with \$2,702,000 for the 1937 crop.

Wheat—The 1938 crop of 19,068,000 bushels was the largest produced in Colorado since 1930, and compared favorably with the 15,155,000 bushels produced in 1937, and the 1927-36 average of 13,834,000 bushels. Due to much lower prices the farm value of this relatively large crop was only \$9,343,000, compared

with \$13,848,000 for the much smaller 1937 crop. The yield per acre averaged 14.5 bushels for both winter and spring wheat, the highest in more than 10 years.

Corn—Production of corn harvested for all purposes was estimated at 11,655,000 bushels against 8,536,000 bushels in 1937, and 17,039,000 bushels, the 10-year average. The quantity of corn harvested for grain was estimated at 9,706,000 bushels, compared with 5,760,000 bushels harvested in 1937, and 14,839,000 bushels, the 10-year average. Irrigated yields were good with non-irrigated yields fair to poor. The inventory value of the 1938 crop was placed at \$5,245,000, compared with \$5,378,000 for 1937 production.

Oats—Oats production was estimated at 5,053,000 bushels against 4,433,000 bushels in 1937, and 4,609,000 bushels, the 10-year average. Yield per acre at 31.0 bushels was above average, and higher than any obtained since 1931. Of the 163,000 acres harvested, approximately 95,000 acres were irrigated. The inventory value of the 1938 crop was \$1,364,000, compared with \$1,773,000 for the 1937 crop.

Barley—The 1938 barley crop totalled 11,985,000 bushels, and was the largest ever raised in the state. Production in 1937 was 8,772,000 bushels, and the 10-year average 7,968,000 bushels. The yield of barley per acre in 1938 was above average at 23.5 bushels. A total of 510,000 acres were harvested, of which 215,000 acres were grown under irrigation. The farm value of the 1938 crop was placed at \$3,596,000, compared with \$4,474,000, the farm value of the 1937 crop.

Sorghums—The 1938 crop of grain sorghums harvested for all purposes, estimated at 4,631,000 bushels, was the largest since 1920, and the third largest of record. A total of 421,000 acres were harvested, of which only 84,000 acres were harvested for grain; the bulk of the acreage being harvested as forage feed. The quantity of grain sorghum harvested for grain in 1938 was estimated at 1,008,000 bushels, compared with 352,000 bushels so harvested in 1937. A total of 337,000 tons of forage were harvested in 1938. The entire grain sorghum crop was valued at \$1,575,000 in 1938, compared with \$715,000 for 1937 production. Due to the introduction of new and improved varieties and because of their drought-resistant qualities, sorghums have increased in favor in recent years, and are being substituted for corn on many farms in the eastern non-irrigated sections of the state.

Sweet, or saccharine sorghums, as producers of forage feed, are being grown extensively in eastern Colorado. In 1938, 285,000 acres of sweet sorghums were harvested, compared with 211,000 acres in 1937. Production of forage totalled 285,000 tons in 1938, compared with 148,000 tons in 1937, and 109,000 tons, the 10-year average. Value, 1938, \$1,112,000; 1937, \$918,000.

All Tame Hay—In 1938, 1,892,000 tons of tame hay were harvested from 1,084,000 acres. In 1937, 1,661,000 tons were harvested from 1,022,000 acres. Average production during the 10-year period 1927 to 1936 was 1,898,000 tons. This hay, together with the supply of sorghum forage provided ample feed for carrying livestock through the winter of 1938-39. Hay prices were relatively low during this period, and the 1938 crop had a farm value of only \$11,541,000, compared with \$12,956,000 for the smaller 1937 crop.

The alfalfa hay crop (included with all tame hay) of 1938 was estimated at 1,388,000 tons, compared with 1,240,000 tons in 1937, and 1,390,000 tons, the 10-year average.

Wild Hay—A good supply of early moisture, together with a good supply of irrigation water, and a favorable growing season in the mountain and San Luis Valley sections resulted in a wild hay crop of 374,000 tons. This was well above 1937 production of 356,000 tons, and above the 10-year average of 334,000 tons. The 1938 crop was valued at \$2,244,000, compared with \$2,492,000 for the 1937 crop.

Broomcorn—Production in 1938 totalled 3,800 tons, and was the largest crop harvested since 1933. Production in 1937 was 2,100 tons. The 1938 crop was valued at \$171,000, compared with \$116,000 for 1937 production. During the period 1927 to 1932, Colorado ranked high among the states as a producer of broomcorn. In 1930 the state produced 10,400 tons. Baca county, located in the far southeastern corner of the state, is the principal producer. Rainfall and growing conditions have been very unfavorable in that area in recent years, and broomcorn crops have been small. Most of the broomcorn grown in Colorado is of the dwarf variety.

Field Peas—The decline in acreage, which began in 1931, continued in 1938, and only 22,000 acres were harvested, compared with 26,000 acres in 1937. The 1938 acreage was less than half the area grown in 1930. Production in 1938 was estimated at 198,000 bushels against 260,000 bushels in 1937, and 402,000 bushels,

the 10-year average. In a number of earlier years, production exceeded one-half million bushels. A substantial portion of the acreage is grazed in the field by livestock. In recent years not only has the total acreage declined, but the proportion of the total acreage harvested for grain has also declined.

FRUIT

Apples—The 1938 apple crop was relatively large, being particularly so in the Delta county area on the Western Slope. Production of total apples was estimated at 1,982,000 bushels against 1,457,000 bushels in 1937 and 1,968,000 bushels the ten-year average. Commercial production totalled 1,746,000 bushels in 1938 and 1,116,000 bushels in 1937. The total crop of 1938 was valued at \$1,387,000 compared with \$1,002,000 for 1937 production. Rail car loadings from the 1938 crop were 1,322 cars and from the 1937 crop 392 cars. In addition 30 million pounds from the 1938 crop were moved by truck compared with 20 million pounds from the 1937 crop.

Apples produced in Colorado are of excellent quality, flavor and color. The commercial industry is concentrated in a few counties. Delta county on the Western Slope has nearly one-half the apple trees in the state. Fremont county ranks second in number of trees, but many of the orchards in this county are small and some have been badly neglected. Mesa county, also on the Western Slope, is third in number of trees and produces many commercial apples. Larimer county in Northern Colorado is also important in the production of commercial apples from orchards in the vicinity of Fort Collins. Other counties important in apple production are Montezuma and Montrose in Western Colorado, and Boulder and Jefferson north and west of Denver.

Peaches—Another new high record of production was established in 1938 with a crop of 1,634,000 bushels. This compared with 1,533,000 bushels, the previous record crop of 1937, and 1,013,000 bushels the ten-year average. The 1938 crop was valued at \$1,144,000 and the 1937 crop at \$1,380,000. Rail cars shipped in 1938 totalled 1,825 cars against 2,163 cars in 1937. Average loading per car was higher in 1938. A total of 27 million pounds were moved by truck in the 1938 marketing season compared with 21 million pounds in the 1937 marketing season.

The peach industry in Colorado is rather unique in that the orchards are concentrated in two distinct areas, and the fact that the entire crop moves to market in the short period of approximately six weeks, in August and September. During this time Colorado peaches dominate the market supply in many consuming centers throughout the country.

Fully two-thirds of the trees are located in Mesa county of Western Colorado. In this county most of the trees are located on the Orchard Mesa near Palisade and Grand Junction. The balance of the commercial crop is grown in Delta county in areas near the towns of Cedaredge, Paonia, and Hotchkiss. Climate, soil, and air-drainage are favorable for peach production in all these sections, and water for irrigation is abundant. In recent years many trees infected with mosaic have been removed, but these removals have been more than offset by replacement plantings and plantings of additional new orchards. Production appears to be on the up-trend, as new trees are coming into bearing each year.

Pears—Production in 1938 totalled 251,000 bushels, compared with 153,000 bushels, which was the smallest crop produced in any year since 1916. Value of the 1938 crop was \$126,000, compared with \$130,000 for the small 1937 crop. This fruit crop was much more important in Colorado during the period from 1920 to 1929, when crops of between 500,000 and 600,000 bushels were produced. In recent years many orchards have been pulled and production has ranged between 200,000 and 300,000 bushels. Disease, principally blight, low prices, and the necessity for frequent spraying have been the principal causes of the decline of this crop.

Cherries—The 1938 crop of 5,280 tons was the largest in more than a decade. Production varies greatly from year to year, largely due to winter freeze injury or damage by late spring frost. Production in 1937 was 3,460 tons and in 1936 only 700 tons following the severe February freeze of that year. Cherries produced in Colorado are mostly of the sour variety, although some sweet cherries are produced on the Western Slope, in Mesa and Delta counties. Many Colorado cherries are canned at plants located in Loveland, Fort Collins (near), Canon City, Grand Junction, and Delta.

Larimer county ordinarily produces nearly two-thirds of the state's cherry crop, followed by Fremont, Mesa, Jefferson, and Delta counties in order of importance.

Grapes, Apricots, Plums—Grapes are grown primarily in Mesa, Delta, Fremont and Garfield counties, and also in the area tributary to Denver. In 1937, 570 tons of grapes were harvested, compared with 600 tons in 1936 and 477 tons the ten-year average. Plums are also grown in these counties, but on a relatively small scale. Apricots are grown in the same two counties which produce peaches on a commercial scale.

Strawberries, Raspberries—These two berry crops and other berries are grown primarily in Jefferson county and in other areas tributary to Denver. A portion of these fine quality berries is shipped to outside markets, but the bulk of them go to supply the Denver market. These small fruits are also produced in some volume in Larimer, Garfield, Fremont, Mesa, and Delta counties.

TRUCK CROPS (Commercial Vegetables)

Colorado vegetables are known throughout the country for their fine quality and flavor. The industry is an important one as related to the amount of labor employed, the gross value of the crop produced, and the high value per acre.

In 1938, about 60,000 acres were devoted to commercial vegetables worth about \$5,500,000. In 1937, only 56,490 acres were harvested, but the crop was worth \$7,636,000. These crops are grown almost entirely in the irrigated areas, although some crops such as lettuce and spinach are grown in the northwest and mountain areas without irrigation.

The rank of truck crops in relation to the acreage devoted to each of them is as follows: Green peas, cantaloupes, and honey-dew melons, cabbage, tomatoes, lettuce, onions (dry), snap beans, cauliflower, spinach, celery, and carrots. Other vegetables, such as broccoli, egg plant, peppers, turnips, radishes, green onions, in fact practically all of the common garden vegetables, are grown somewhere in Colorado. The quantity of these vegetables in the second group is rather small and most of them are consumed locally, but parts of these crops reach markets outside the state through truck or express shipments.

Cantaloupes and Honey-Dew Melons—This crop is a very important one in the Arkansas Valley, where shipments supply a large percentage of the nation's total consumption during the months of August and September. "Rocky Ford" cantaloupes have been long known for their splendid flavor. Recently a large part of the acreage has been planted to "Resistant 45's," which permits vine ripening without reducing shipping quality. Many cars are now being "pre-cooled" before shipment and this, together with vine ripening is placing Colorado cantaloupes on consumer tables with even better quality and flavor than formerly.

The proportion of honey-dew melons has increased greatly in recent years and a substantial percentage of these melons is also vine ripened and pre-cooled before shipment. In most years quality and flavor is excellent. Consumers may look forward to an even better product in the future. Colorado vine-ripened honey-dews are a real treat.

Counties which lead in production are Crowley, Otero, Pueblo, Bent, Adams, Weld and Mesa.

Green Peas—This crop is grown to supply both the canning and fresh vegetable market. A goodly portion of the peas grown in Northern Colorado, in the Canon City area, and in the San Luis Valley is canned each year, but the fresh crop from these areas is widely distributed. In 1938, 12,000 acres were grown for the fresh vegetable market, and 3,170 acres were grown for canning. The total crop was valued at \$890,000. Principal producing counties are Conejos, Costilla, and Custer, where the bulk of the crop is shipped fresh. Production in Boulder and Larimer counties is largely canned.

Cabbage—Cabbage of the Early Domestic type supplies the summer market, beginning in July, while the Late Danish types supply the fall and winter markets. The bulk of the crop is produced in Weld, Adams, and Costilla counties. A small quantity is canned as kraut each year. The 1938 crop of all cabbage was grown on 5,480 acres but was valued at only \$249,000, as prices were ruinously low. Quality and flavor of Colorado cabbage are excellent.

Cauliflower—The bulk of this crop is grown in Costilla county in the San Luis Valley, and at an elevation of 7,500 feet above sea level. This county is one of the leading counties in the United States in the production of cauliflower. Pueblo, Adams, Fremont and Custer counties also grow this crop in considerable volume. In 1938, 3,000 acres of cauliflower were harvested, but due to low prices the crop grossed only \$300,000.

Tomatoes—About two-thirds of the acreage is grown for canning, either as juice or fruit. The crop grown in the Arkansas Valley is canned extensively,

which is also true of the crop grown in Weld and Adams counties. Harvest begins in August and continues until frost. Due to abundant sunshine and the varieties grown, these tomatoes produce an unusually fine pack. Fresh tomatoes trucked and shipped by rail from Colorado are a pleasing product in the consuming markets.

In 1938, only 5,100 acres of tomatoes were grown, of which 2,900 were grown for manufacture and 2,200 acres were grown for the fresh vegetable market. The total crop was valued at \$322,000. The season was unfavorable and yields were low. Blight and psyllid were responsible.

Celery—Colorado giant and short strain Pascal celery is probably the most talked of and highly praised vegetable product. A large percentage of the crop is grown immediately north and west of Denver in Jefferson and Adams counties. Minor producing areas are in the vicinity of Canon City and just east of Pueblo. Small quantities are also grown in Otero county and in several counties on the Western Slope.

A large percentage of Colorado celery is wrapped with paper for bleaching in the field and is then placed in trenches for further bleaching and storing for the Thanksgiving and Christmas markets. Trenched celery has a quality and flavor not exceeded anywhere. In recent years much Colorado celery has been shipped in individual gift packages during the Holiday season. Only a small portion of the crop moves in carloads, but shipments by express go to all parts of the country and additional quantities move by truck. In 1938, 1,250 acres of celery were harvested, compared with 1,200 acres in 1937. Production in 1938 totalled only 275,000 crates, worth \$358,000. While the cost per acre of producing celery is large, the average value of the crop per acre is usually the highest for any crop grown in the state. In some years the value per acre has exceeded \$500. Yields were low in 1938 due to rust and blight. Prices were also low.

TRENDS IN COLORADO AGRICULTURE SINCE 1929

General Trends—Significant changes have taken place in the Colorado agriculture industry since 1929. Part of these have been forced upon the industry by economic factors, such as low prices and the difference in cost of production. Others have resulted from the shortage of rainfall and above normal temperatures which have occurred during most growing seasons since 1930. Some changes have resulted from the influence of both economic and weather factors. The agricultural plant has been run less extensively since 1932 than in that year or several years preceding. In 1929, nearly 7,400,000 acres of crops were planted or grown, of which 6,600,000 acres were harvested. In 1932, farmers endeavored to offset low prices by planting larger acreages of nearly all crops and thereby increase income. In that year, 8,500,000 acres were planted or grown (a record high acreage) but an unfavorable growing season resulted in failure of about four out of ten acres, and only 5,850,000 acres were harvested. Ever since this costly experience the agricultural plant has been operated on a smaller scale. (Nearly all of this contraction has occurred in the eastern plains section of the state.) In 1934 only a little over 7,100,000 acres of all crops were planted or grown and in no year since that time has the total equalled 7 million acres. In 1938 only 6,760,000 acres of crops were planted or grown but the season was fairly favorable and 5,941,000 acres of all crops were harvested. Realizing the need for conservation of both soil and moisture, farmers in the non-irrigated sections of Eastern Colorado began summer fallowing a larger percentage of their crop land. There has been a general trend toward increasing the number of acres per farm. As the smaller operators left, those remaining have leased or purchased the land and have added this acreage to their own unit. More farmers now operate units of 1,000 acres or more than were operated in units of this size five years ago. This had made for more economical use of power machinery and enhanced proper soil management. With this consolidation of units, increased use of power machinery and less intensive use of crop acreage in Eastern Colorado, it is obvious that farm population in these areas has declined. Some farm people who have moved from this non-irrigated area have left the state, others have moved to cities within the state, while still others have moved to irrigated areas within the state. Tracts have been taken over in the irrigated San Luis Valley and in the irrigated western valleys and on the mesas. During the last several years considerable non-irrigated land in southwestern Colorado has been cleared of sagebrush and other native vegetation and planted to pinto beans. This new land has provided homes for a considerable number of farm families who have moved from Eastern Colorado and other states.

Acreage Trends—Since 1929 there has been a general down trend in the state's acreage of corn, oats, alfalfa, sugar beets, beans, wheat and broomcorn.

There has been an up trend in the acreage of sorghums and barley, while the acreage of potatoes and wild hay has continued fairly steady. There has been a pronounced down trend in the production of apples and pears and an equally pronounced up trend in the production of peaches. The down trend in acreage of corn has resulted to a considerable extent from the substitution of both grain and sweet sorghums. Sorghums have increased in favor in recent years. The drouth resistant qualities of these plants and the introduction by the state experiment stations of better adapted and improved varieties of grain sorghum has given these crops an advantage over corn. The stability of the livestock industry in Eastern Colorado is largely dependent upon production of an abundant supply of feed in favorable years. Sorghums are aiding greatly in meeting this requirement of the livestock industry. Although there has been a general down trend in the total acreage of corn, the acreage grown under irrigation has increased since 1929 and much of this increase has taken place in the last few years. The down trend in the acreage of oats has occurred wholly in the non-irrigated sections. The acreage grown under irrigation has increased. The down trend in the acreage of sugar beets has been pronounced. The largest acreage ever grown in Colorado, 242,000 acres, was harvested in 1930. The acreage declined gradually till in 1938 only 137,000 acres were harvested. Failure of the crop to show profits commensurate with the difficulty and expense involved in growing the crop has caused many farmers to grow smaller acreages and others to substitute other crops. For many years Colorado ranked first among the states in the production of sugar beets and beet sugar. California ranked first in 1938.

The alfalfa acreage has declined almost steadily for over 15 years. General prevalence of bacterial wilt has necessitated replanting every three to five years if stands yielding a satisfactory tonnage were to be maintained. This has increased the expense of growing the crop. Growing of alfalfa is closely correlated with the general welfare of the livestock feeding and dairy industries in the irrigated sections of the state and it is hoped that as wilt resistant varieties become available from the increase plats of plant breeders, that this down trend will be overcome and reversed. In 1924, Colorado had 890,000 acres of alfalfa. By 1930 this acreage had declined to 826,000 acres and in 1937 only 636,000 acres were harvested.

The general trend of the dry bean acreage has been down since 1929 although a large acreage was harvested in 1935. In each of the years 1925 to 1931 over 300,000 acres of beans were harvested. In most years since 1931, less than 300,000 acres have been harvested. The decline in acreage has occurred entirely in the eastern non-irrigated sections. This decline has more than offset the increase in irrigated areas. In recent years a larger proportion of the Colorado bean crop has been grown on irrigated land. These irrigated sections in order of importance are: The Northern Colorado area, which has over half the state's irrigated acreage; the Fruita area west of Grand Junction, where production has increased sharply in recent years, and the Arkansas Valley section. The trend of non-irrigated acreage has also been sharply upward in Montezuma and Dolores counties of the Southwest, and this area promises to be one of greater importance in subsequent years.

The acreage of wheat declined irregularly from 1930 to 1935, yields were low and crops small. After 1935 a gradual up trend developed, as more land was summer fallowed. Winter wheat has accounted for a larger proportion of the total during the last few years and it appears that in the future spring wheat may further lose favor while winter wheat gains in favor. Such a change if it occurs will be primarily in northeastern and east central Colorado, as the San Luis Valley grows spring wheat almost entirely and more than half the acreage on the Western Slope is spring wheat.

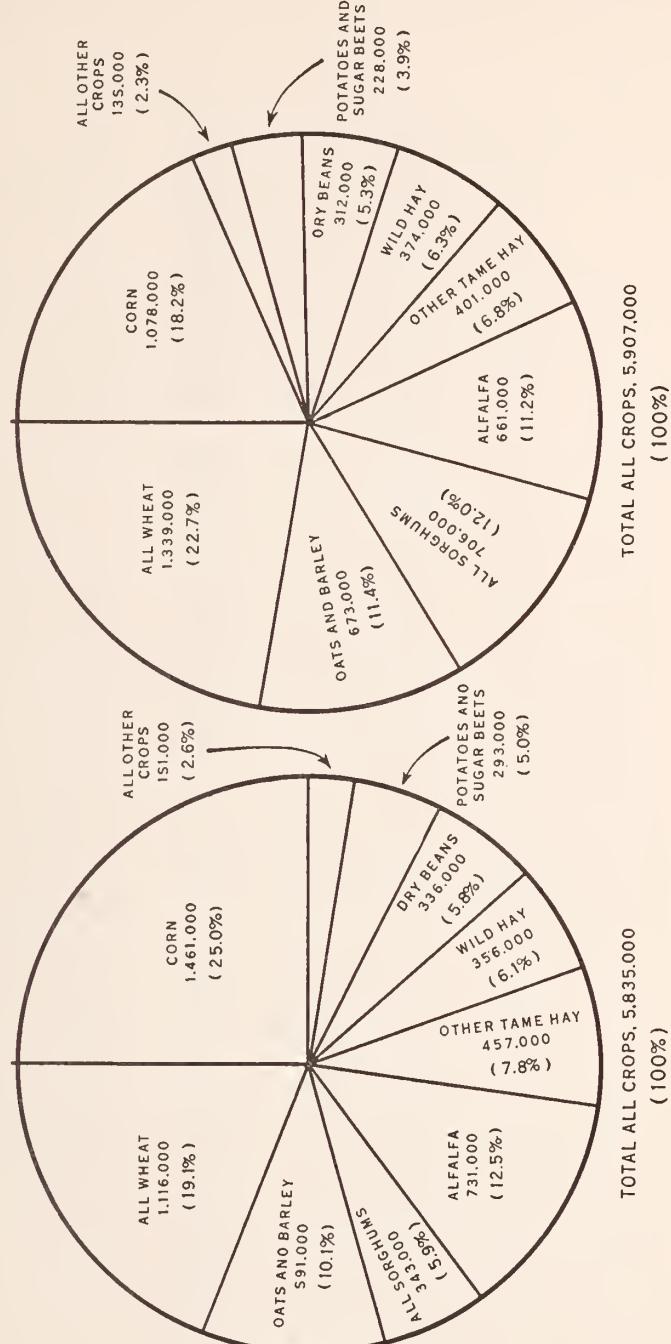

The trend of apple production has been generally downward since 1922. During the ten years prior to 1929 crops of between two and three million bushels were the rule. Since 1929 crops in excess of two million bushels have been an exception. In recent years many trees have been removed, many old orchards have been neglected, and new plantings have been fewer. It appears that this down trend may continue. Production of pears has declined since 1924 and the crop continues to lose favor among growers. Many trees have been removed and new plantings are few.

Peaches have gained in favor as apples and pears declined. Many new trees have been planted and the up trend in production which has been under way for over fifteen years is expected to continue as new plantings become of bearing age.

LIVESTOCK INVENTORY AND VALUE

There were more stock sheep, hogs, and chickens on Colorado farms January 1, 1939, than a year earlier, and fewer sheep and lambs in feed lots. There were also fewer beef cattle, and milk cows, and the number of both horses and mules continued to decline.

The number of stock sheep increased 3 per cent, chickens 12 per cent, and hogs 10 per cent; while total cattle decreased 3 per cent, horses 5 per cent, and mules 4 per cent. The inventory value of all livestock on farms January 1, 1939, (including chickens) totalled \$87,599,000, compared with \$86,879,000 a year earlier and \$94,417,000 January 1, 1937. The 1939 value was significantly higher, compared with the low value January 1, 1933, of \$48,771,000, and significantly lower compared with the high value January 1, 1930, of \$133,891,000.

All Cattle—The number of all cattle and calves was estimated at 1,447,000 head, compared with 1,492,000 January 1, 1938, and 1,570,000 January 1, 1937. The decline in numbers during 1938 was primarily in steers and heifers. The total value for January, 1939, was placed at \$50,463,000, compared with \$46,826,000 a year earlier. The value per head increased from \$31.40 to \$34.90 during 1938. The number of cattle in Colorado reached the peak of recent years January 1, 1934, with 1,733,000 head.

Milk Cows—The number of milk cows declined slightly to 243,000 head, compared with 245,000 January 1, 1938, and 253,000 January 1, 1937. Value per head at \$48.00 was up \$2.00 from the January 1, 1938, level, and total value increased from \$11,270,000 to \$11,664,000. The 1939 number of milk cows was 57,000 less than the record number of 300,000 head on January 1, 1934. Numbers declined sharply following the drought of that year and have not recovered since, but grade and quality of milking animals has improved.

Sheep—The number of stock sheep, at 1,718,000 head, was up 3 per cent from the January 1, 1938, total of 1,668,000 head, and compared with 1,737,000 January 1, 1937. Aged ewes were marketed rather liberally in 1938, but these disposals were offset by larger holdings of ewe lambs. The number of sheep and lambs in feed lots totalled 1,090,000 head, compared with 1,185,000 January 1, 1938, and 1,030,000 January 1, 1937. The total value of all sheep and lambs January 1, 1939, was \$16,760,000, compared with \$17,356,000 a year earlier, and \$17,216,000 two years preceding.

Hogs—The increase in hog numbers was relatively large and on January 1, 1939, Colorado farmers had 278,000 hogs, compared with 253,000 one year previous and 298,000 two years previous. Much of the increase during 1938 was in sows bred for spring litters, which promised to be 45 per cent larger in 1939 than in 1938. Although the increase in inventory numbers during 1938 was fairly large, hog production in Colorado was still at a low level and below a desirable minimum. The inventory value of hogs January 1, 1939, was \$2,868,000, compared with \$2,485,000 January 1, 1938, and \$3,369,000 January 1, 1937. Value per head January 1, 1939, at \$10.30 was 50 cents higher than a year earlier.

Horses—Horse numbers continued the decline which began 20 years previously when Colorado had 440,000 head. On January 1, 1939, numbers totalled 237,000 head, compared with 249,000 January 1, 1938, and 259,000 January 1, 1937. Deaths due to advanced age and failure to raise sufficient colts for replacement, together with increased use of power machinery accounts for this sharp decline of over 200,000 head in the 20-year period. Not only were numbers smaller, but values were lower. Twenty years ago Colorado horses averaged \$91.00 per head, while on January 1, 1939, this average was \$59.00, and on January 1, 1938, \$68.00. The total value of horses January 1, 1939, was \$14,066,000 against \$16,813,000 January 1, 1938.

Mules—Mules on farms January 1, 1939, totalled only 15,000 head, compared with 16,000 January 1, 1938. The 1939 number was less than half the peak number of 38,000 head January 1, 1925. Value per head decreased from \$85.00 to \$77.00 during 1938. The total value January 1, 1939, was \$1,162,000 compared with \$1,365,000 a year earlier.

Chickens—The number of chickens increased sharply during 1938, and on January 1, 1939, the total was 3,800,000 head, compared with 3,390,000 one year preceding and 3,580,000 two years preceding. Value per head was unchanged, but total value increased from \$2,034,000 to \$2,280,000 on January 1, 1939.

Lamb Crop—The number of lambs docked or saved in 1938 was estimated at 1,240,000 head, compared with 1,250,000 head saved in 1937. In 1934 the lamb crop totalled 1,270,000 head, which was the largest of record. Beginning with 1929, lamb crops have exceeded one million head each year. In 1938 a total of 87 lambs were saved for every 100 ewes one year old and over on hand at the beginning of the year. This lambing percentage was relatively large and reflected the good condition in which ewes came through the winter of 1937-38 and the favorable weather at lambing time.

Wool—The 1938 wool clip totalled 12,862,000 pounds. In 1937, 13,243,000 pounds of wool were shorn, while the record clip of 1931 totalled 13,541,000 pounds. Prices received for the 1938 clip averaged only 18 cents per pound, compared with 32 cents for the 1937 clip. The total value of the 1938 wool clip was \$2,315,000, just a little more than half the value of the 1937 clip, which was \$4,238,000.

Calf Crop—In most years the number of calves born in Colorado totals slightly over one-half million head. The number born in 1938 was estimated at 536,000 head. In the years 1933 and 1934 the number exceeded 600,000 head. These estimates include dairy calves as well as beef calves born under farm and range conditions.

Pig Crop—The number of pigs saved from both spring and fall litters in 1938 was estimated at 317,000 head. This was less than two-fifths the number saved in 1931, when hog production reached the peak of recent years with 755,000 pigs saved. The 1938 level of hog production was below a desirable minimum. However, this low level of production was largely forced upon Eastern Colorado farmers by several years of drought conditions which resulted in short feed supplies, forcing breeding stock to market. Colorado is rather favorably located as related to market outlets for hogs. In addition to the local demand and the demand of the Denver Stockyards market, hogs can be shipped to the Pacific Coast at a good price advantage. Frequently, in recent years, prices on the Denver market have equalled or exceeded prices paid at Omaha, Kansas City and other Missouri River markets.

Chickens—Colorado leads the states in the Rocky Mountain region in the production of chickens and eggs. Of the eleven states located west of the one hundred second meridian, only California and Washington exceed Colorado in production. A large percentage of the chickens and eggs produced in Colorado are produced by flocks of less than 400 hens and pullets, which are a complement to general farm operations. There are, however, approximately 200 commercial flocks in the state having in excess of 1,000 birds each.

There were 3,800,000 chickens on farms January 1, 1939, and 5,582,000 chickens were produced during 1938. Egg production in 1938 was estimated at 525 million. The value of chickens and eggs sold from farms during 1938 totalled \$5,245,000 compared with \$5,357,000 for sales during 1937. In addition, chickens and eggs eaten on farms during 1938 were valued at \$2,666,000. It is obvious from the size of these figures that the chicken industry in Colorado is a desirable complement to the farm enterprise, both as related to the farm family living, as well as a provider of ready cash.

Turkeys—The number of turkeys raised annually usually totals between 500,000 and 600,000 birds. The 1938 turkey crop was estimated at 513,000 birds compared with 570,000, the 1937 crop. These birds are produced by many experienced growers, who raise them on a commercial scale, although a good many birds are raised in small farm flocks.

A large percentage of Colorado turkeys are of good quality and are marketed as dressed birds. Climate is favorable for the turkey industry. Turkeys are raised in nearly all counties in the state, but are grown commercially primarily in Larimer, Weld, Jefferson, Morgan, Adams, Washington and Yuma counties of Northern Colorado and in Otero and Prowers counties in the southeast. Turkeys are also raised commercially on the Western Slope, where Delta, Montrose and La Plata counties lead.

Livestock Feeding—Colorado leads the country as a producer of grain-finished lambs, and fattens annually about 25 per cent of the nation's total. The Northern Colorado section is advantageously located as related to the source of feeder lambs. Feeders can be obtained directly from ranges in Colorado and other western sheep states, or from the Denver stockyards, which is the largest sheep and lamb market in the country. This market also provides adequate facilities for marketing the finished product. Colorado lamb feeders fatten from

1 to 1½ million lambs annually. The lamb feeding industry is a natural complement of the beet sugar industry. Feeding of these animals is the most advantageous means of utilizing the beet top and beet pulp, by-products of the growing and manufacture of sugar beets. Sugar beets are grown as a general cash crop in the four feeding areas of Northern Colorado, the Arkansas Valley, the Western Slope sections and the San Luis Valley of Southcentral Colorado. Locally raised feed grains and alfalfa provide most of the additional grain and hay needed for a balanced fattening ration. (See page 130.)

Fattening of cattle in the four feeding sections, while done on a smaller scale than lamb feeding, is none the less an important part of the agricultural industry in these sections, particularly the Northern Colorado area. From 100,000 to 175,000 cattle are fattened in these sections annually. (See page 132.)

TRENDS IN LIVESTOCK INDUSTRY IN RECENT YEARS

The number of all cattle increased from 1928 to 1934. On January 1 of that year the number at 1,773,000 head was the largest since 1919. The 1934 drouth resulted in extensive liquidation during 1934 and 1935. Numbers decreased gradually thereafter and on January 1, 1939, the state had only 1,447,000 head of cattle and calves. It appears that numbers during the next few years may stabilize at this level or one slightly lower. The number of milk cows increased gradually for a long period of years and reached a peak on January 1, 1934, with 300,000 head. The 1934 drouth caused considerable liquidation of milk cows also. It appears now that numbers have become fairly stable at between 240,000 and 250,000 head. Quality of milking animals has been improved during the last few years and average production of milk per cow has increased noticeably.

The number of stock sheep and lambs which are run largely under range conditions has not changed greatly in the last ten years. Numbers have fluctuated between 1,650,000 and 1,730,000 head during the last few years. Favorable spring weather has enabled sheepmen to raise a goodly percentage of the lambs which were born and lamb crops totalled approximately 1,250,000 head in each of the years 1936, 1937 and 1938. The number of lambs grain finished for market has declined gradually since 1930, when the record number of 2,035,000 head were in feed lots on January 1 of that year. On January 1, 1939, only 1,090,000 lambs were in feed lots. Speculation in the lamb feeding industry has diminished greatly in recent years, and present indications are that it will be some years before lamb feeding is again carried on at the high level which prevailed from 1928 to 1932. During each of these five years the number in feed lots January 1 exceeded 1½ million head.

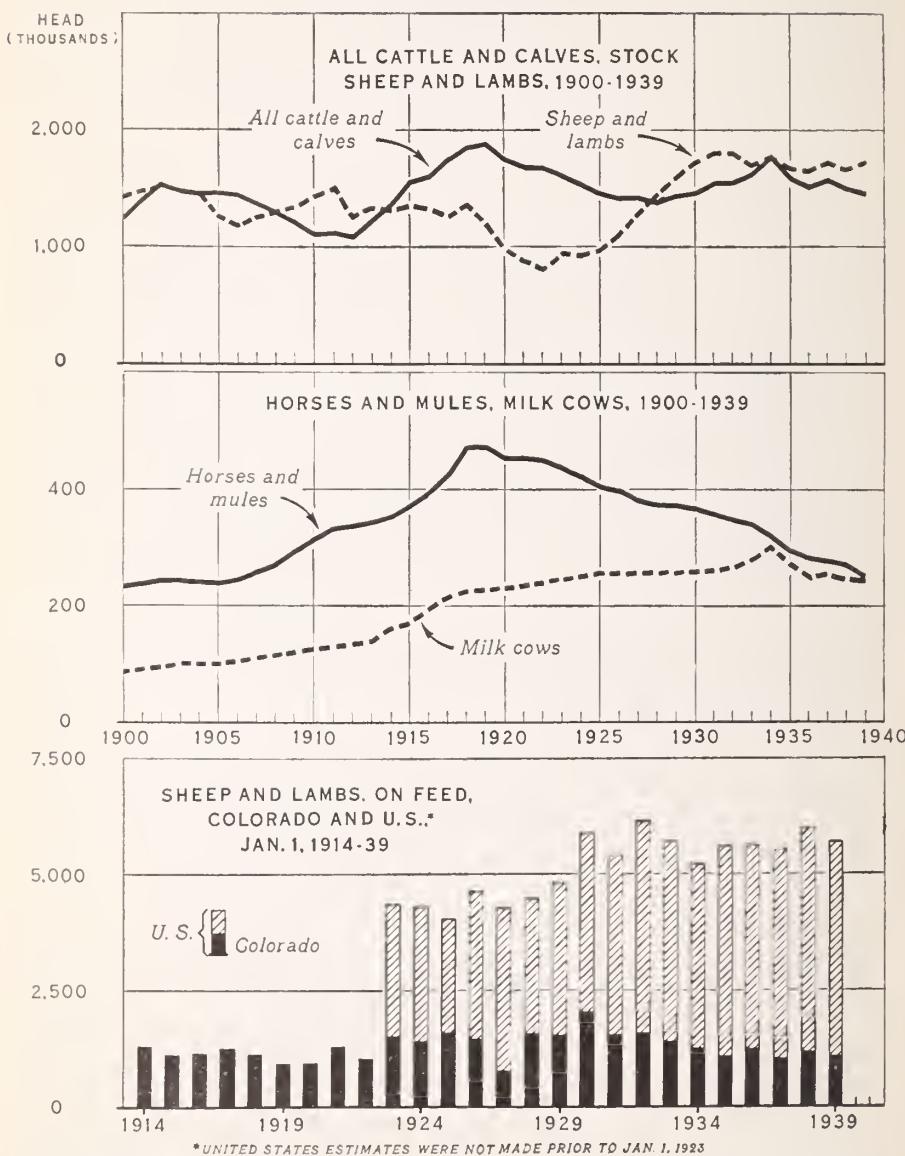

Hog production has declined sharply in Colorado since 1932. On January 1 of that year hog numbers were at the record high level of 624,000 head. At the beginning of each year from 1928 to 1933 (1930 excepted) the hog inventory exceeded one-half million head. By January 1, 1935, the inventory had declined to 268,000 head, or to less than half the 1928-33 average. Since 1935 the inventory has fluctuated between 250,000 and 300,000 head. Due to geographical market advantages the hog industry should regain some of its former importance and indications are that the inventory may be on the up trend.

The number of horses reached the highest level in the state's history on January 1, 1918, with 440,000 head. After January 1, 1919, numbers began to decline and the decline continued each year thereafter till on January 1, 1939, only 237,000 head remained on farms. This was a decrease over this 20-year period of 10,000 head per year and a total loss of 46 per cent. Not only is the present inventory low but many horses are of advanced age and death losses in recent years have been fairly high. Births of colts have not yet been sufficient to offset these death losses and it appears that horse numbers will continue to decline for several more years but the rate of decline will probably be slower. The 1939 inventory of 237,000 head consisted of approximately 43,000 saddle or cow ponies and 194,000 animals (including colts) of a type suitable for work stock.

The number of mules in Colorado has never been large as the inventory reached a peak in 1924 with 38,000 head. The number declined each year after 1925 and on January 1, 1939, only 15,000 mules remained on farms. The number of mules may decline further due to the lack of sufficient desirable brood mares.

F. K. REED,
Agricultural Statistician.

LIVESTOCK NUMBERS ON FARMS, JANUARY 1, 1900-1939

HORSES AND COLTS (ON FARMS), 1880-1939

IRRIGATION IN COLORADO

Colorado ranks second among the states in the country in number of acres under irrigation. With approximately 3,400,000 acres irrigated, Colorado is exceeded only by California. The effect of irrigation upon crop yields in the state is well illustrated by the chart on this page. This reveals for the crops shown, that irrigated yields per acre are approximately three times those obtained without irrigation. Although soil, the amount of natural moisture, the section of the state in which the crops are grown, and other factors affect yields, the supplying of sufficient moisture is the principal factor which determines yield per acre. Irrigation eliminates much of the hazard which attends crop production in the semi-arid portions of the United States. The average yield per acre of corn grown under irrigation in Colorado during the ten years 1928 to 1937 ranged between 25 and 40 bushels per acre (1934 excepted) and averaged 29.0 bushels. Winter wheat yields ranged between 22 and 34 bushels and averaged 26.6 bushels per acre. Spring wheat had a range of from 22 to 30 bushels with an average of 24.0 bushels. Oats ranged between 36 and 42 bushels per acre and averaged 38.4 bushels. Barley yields ranged between 31 and 39 bushels per acre and averaged 34.1 bushels. These figures are averages for the state as a whole. Many individual farmers obtained yields of each of these crops much in excess of these averages. During the same ten-year period quoted above the highest average yields obtained for any of these crops grown without irrigation was 21 bushels per acre. Both corn and oats made this average in 1930.

Good yields are obtained from dry edible beans grown under irrigation. During the ten years 1928 to 1937 bean yields ranged between 700 and 1,080 pounds per acre and averaged 777 pounds per acre. Potatoes respond well to irrigation and yields usually average above 150 bushels per acre. In 1930 the state average was 200 bushels per acre. Sugar beets also thrive in Colorado climate and the many days of fall sunshine provide relatively high sugar content. Average yields range between 11.3 and 13.7 tons per acre and usually exceed 12.5 tons and are among the highest obtained in the United States.

Over 90 per cent of the Colorado alfalfa acreage is grown under irrigation and yields averaged 1.9 tons per acre during the ten years, 1928 to 1937. A large percentage of the wild hay acreage is irrigated and yields usually exceed one ton per acre.

In recent years there has been an up trend in the irrigated acreage of corn, beans, wheat, oats and barley. The trend of the irrigated acreage of sugar beets and alfalfa has been down.

PUMP IRRIGATION IN COLORADO

Number of Wells and Capacity as Enumerated by County Assessors—Spring 1939

Colorado farmers have 1,629 irrigation wells capable of delivering 2,361 cubic feet of water per second or enough water to cover approximately 5,000 acres of land to a depth of one foot every twenty-four hours. The average capacity per well is 1.45 cubic feet per second. This is the first state-wide enumeration of number of wells and capacity ever made in Colorado. Many of these wells are used to provide the entire supply of water for irrigation of crops, while others are used to supplement the supply of ditch water. During 1939 water from these irrigation wells produced good yields on many an acre which would have otherwise been near failure because of the shortage of ditch water.

Weld county leads in total number of wells with 712 and also leads in the total number of cubic feet of water which can be pumped per second, the total capacity being 1,052 second feet. This is about 45 per cent of the capacity of all wells in the state. Adams county is second in number of wells with 198, followed by Morgan with 153, Pueblo with 135 and Rio Grande with 120. Larimer county has 84, Logan 75, and Jefferson county 34. Each of the other counties in the state has less than 25 wells.

Although Adams county is second in number of wells, this county is greatly outranked by Morgan county in total capacity. The comparison being Morgan 354, Adams 208 cubic feet per second. The total capacity of wells in other counties in cubic feet per second is as follows: Rio Grande 237, Logan 161, Pueblo 105, and Larimer 96.

About 80 per cent of the irrigation wells in Colorado are located in the area lying north of Denver and down the valley of the South Platte river to Sterling. In this area it is significant that wells located in the counties of Morgan, Washington and Logan and adjacent to the South Platte river are high producers. The average capacity per well in these counties is between 2.1 and 2.4 cubic feet per second, while the average for other counties in the area is lower. It is significant also that the one well in Kit Carson county is recorded as having a capacity of 2.2 cubic feet per second and that the one in Phillips county has a capacity of 2.0 cubic feet per second. No other land in either of these two counties is irrigated.

The following table gives detail for each county in which wells and capacity were enumerated:

COUNTY	Number of Wells	Capacity in Gallons Per Minute		Capacity in Cubic Feet Per Second	
		Total	Avg. Per Well	Total	Avg. Per Well
Gunnison	1	2,500	2,500	5.6	.56

Note.—Figures revised by United States Department of Agriculture.

USERS OF AGRICULTURAL STATISTICS AND CROP AND LIVESTOCK REPORTS

(1) By Farmers:

Directly:

- (a) Guide to planning acreage changes of particular crops, and number changes of classes of livestock (basis for agricultural outlook reports).
- (b) Guide to marketing.
- (c) Supplies an official agricultural business service.
- (d) Indispensable in planning farm programs for the benefit of the agricultural industry.
- (e) Widely used by agencies which finance the agricultural industry, such as Federal Land Banks, Production Credit Associations, Private Banking Institutions.

Indirectly:

- (a) Restraints the issuance of wilfully biased or false crop reports and reduces the ill effects of misleading crop reports.
- (b) Reduces speculation. Dependable information on supply stabilizes prices and reduces the speculation margin that is necessarily taken when uncertainty of supply exists. Facilitates a better adjustment of prices in accordance with the facts of supply and demand.
- (c) Aid railroads to distribute the cars needed for moving farm products. Used as factors in rate making.
- (d) Enable economical distribution of farm equipment and supplies.
- (e) Essential for crop programs of agricultural experiment stations, intelligent marketing program of public marketing agencies, making farm loans by banks and insurance companies and the maintenance of maximum farm prices in terminal markets in accordance with supply and demand, all of which react to the farmer's advantage.
- (f) Essential for relief work such as drought relief, seed loans, and other rural relief measures.

(2) Federal Agencies such as the Farm Credit Administration, Soil Conservation, Regional Planning, Production Control, Employment Offices, etc.

- (a) Provides basic data for this work. Enables them to keep closely in touch with the needs of the agricultural industry.

(3) Cooperative Farmers' Associations:

- (a) Guide to intelligent marketing.
- (b) Basis for credit and other business transactions.
- (c) Enables them to formulate constructive programs and policies and market their products to a better advantage.

(4) Marketing Agreements:

- (a) Basis for determining need for marketing agreements. Essential for allocating distribution of grower and dealer representation on the control committees.

(5) Federal Surplus Commodities Corporation:

- (a) Essential in determining which commodities are in surplus and where and how much of them to buy.

(6) Dealers and Handlers of Agricultural Products:

- (a) Show sources of production which help buyers to find products they need.
- (b) Reflect price trends, reduce speculation which goes with uncertainty of supply and reduce the necessary handling margin and enable the payment of maximum farm prices.

(7) Agricultural Experiment Station Extension Workers:

- (a) Best basis for preparing crop and livestock production programs. Gives a measure of the progress and changes resulting from their work.

- (8) State Marketing Organizations:
 - (a) First essential for all marketing programs.
- (9) Schools:
 - (a) Agricultural statistics are more and more being used as a basis for the teaching of agriculture in schools and colleges. Many schools in Colorado are using this material for teaching agriculture and geography.
- (10) Bankers and Financiers:
 - (a) Basis for providing credit for production, storage, and marketing of crops.
- (11) Railroads:
 - (a) Enable economical distribution of cars for moving crops and livestock.
- (12) Insurance Companies:
 - (a) Basis for crop insurance and for placing farm loans.
- (13) Manufacturers:
 - (a) Guide for determining quantities to be manufactured.
 - (b) Best basis for distribution of manufactured products used in agriculture.
 - (c) Guide to locating manufacturing plants and locating supplies of agricultural commodities.
- (14) Advertising Agencies:
 - (a) Enable the placing of advertising to the best advantage.
- (15) Meat Packers:
 - (a) Reduce the uncertainty of supply reflect future price trend, and reduce the necessary handling margin and enable the payment of maximum price which might not be given otherwise.
- (16) Chamber of Commerce:
 - (a) Provide facts for advertising local advantages.
- (17) Prospective Investors, Settlers and Buyers of Land:
 - (a) Best guide to relative agricultural resources and advantages of states and localities.
- (18) Legislators:
 - (a) Authoritative agricultural records needed as the basis for wise and constructive farm legislation.
- (19) Economists and Business Analysts:
 - (a) Essential for analyzing agricultural and business conditions.
- (20) Business Men:
 - (a) Valuable guide for determining when to expand or contract business operations.
- (21) Farm Papers:
 - (a) Basis of editorial judgment regarding agricultural conditions and the type of information likely to be most helpful to farmers.
- (22) National and State Government:
 - (a) Basis for many activities of the Department of Agriculture.
 - (b) Indispensable in the time of war and business crises, and necessary in enacting much of the farm legislation.
- (23) General Public Welfare:
 - (a) Nearly all business is inter-dependent. That is, the prosperity and development of one business depends greatly on the prosperity and development of all other business. Crop reports furnish an indispensable link between agriculture and other lines of business, and their scope and use has been expanded immensely in the disturbed period of years since the World War.
- (24) Consumers:
 - (a) Consumers of farm products benefit by full knowledge of supplies so that they can use more of things which are most abundant.
