REVIEW OF THE 1940 CROP SEASON

(REVISED ESTIMATES)

Production of each field and fruit crop grown in Colorado in 1940 exceeded the quantity harvested in 1939, and production of all except five crops was above the 10-year (1929-38) average. Crops making a particularly good showing were peaches with the largest crop of record, beans and grain sorghums second largest of record. Loss of planted acreage due to crop failure was among the smallest of recent years, and acre yields of most crops were above average. The acreage of all crops harvested totalled 5,504,000 acres compared with 4,925,000 acres harvested in 1939. The spring season opened early and conditions were favorable at planting time. There was a general shortage of stream and stored water for irrigation during July and August but this shortage was partly relieved by drilling additional irrigation wells and capacity use of pumped water. Rainfall was below normal during July and August but growing conditions were generally favorable, and non-irrigated crops were carried through critical period by reserve soil moisture. Rainfall was abundant during September and greatly augmented yields of late maturing crops such as sugar beets, potatoes, and sorghums. The San Luis Valley experienced one of its poorest crop seasons and production of all crops was low. The hay crop was short in the middle mountain section but other sections of the state produced an ample supply of feed for livestock. Farm income (including government payments) during 1940 totalled \$142,813,000 compared with \$135,512,000 in 1939 and was the highest since 1937. Most of the increase in 1940 income was from the livestock industry as prices of most crops averaged lower in 1940 than in 1939.

Potatoes—Production was estimated at 13,936,000 bushels compared with 11,858,000 bushels in 1939. The yield per acre at 208 bushels was the highest of record and resulted largely from the beneficial effect of September rainfall. The northern Colorado section obtained high acre yields again in 1940 and production of 6,100,000 bushels was materially greater than in 1939. Yields per acre were also good in western areas where the crop of 2,124,000 bushels was moderately larger than in 1939. In the San Luis Valley a crop of 5,623,000 bushels was harvested and production was slightly greater than that of 1939. It was necessary to maintain much of this acreage with pumped water due to the shortage of water for direct diversion. Inventory value of the larger 1940 potato crop was only \$5,853,000 compared with value for the 1939 crop of \$7,115,000 due to the fact that average prices received per bushel were much lower in 1940.

Sugar Beets—An unusually large percentage of the acreage was planted early under favorable soil and moisture conditions, and good stands were obtained. In the northern Colorado section the percentage of acreage planted before April 1 was probably the largest ever planted before this date. Due to shortage of irrigation water early in the season, a short crop appeared certain. Much of the acreage, however, was carried through the critical period by use of pumped water and good September rains, together with a late fall, resulted in a 14.9 ton average yield, the highest of record, compared with 10.6 tons in 1939 and 12.4 tons the 10-year (1929-38) average. Production in 1940 totalled 2,092,000 tons compared with 1,543,000 tons in 1939 and 2,248,000 tons the 10-year (1929-38) average. When it is recognized that the acreage harvested in 1940 amounted to only 140,000 acres, the tonnage of beets harvested makes a creditable showing. The high average yield per acre, in addition to being the result of early planting, use of pumped water, late September rains, and favorable late fall weather, was also favorably influenced by most of the beets being grown on ground well adapted to sugar beets, adequate use of fertilizer, and better care.

Beans—Production in 1940 was estimated at 1,965,000 100-pound bags and was the second largest crop ever produced in Colorado. Production in 1939 totalled 1,588,000 bags. The large 1940 crop resulted from larger plantings on irrigated land and from further expansion on new land in the non-irrigated southwestern section, comprising principally Montezuma and Dolores Counties. The crop throughout the state was damaged by frequent September rains which caused considerable discoloration and some loss. The supply of new crop pintos was large at the close of 1940 and the carry-over of old crop pintos was also large and prices ruled low. The 1940 crop was inventoried at \$4,476,000 compared with \$5,399,000 for the 1939 crop. The acreage of beans grown on irrigated land has increased markedly during the last few years. The increase has been general in all irrigated bean-growing areas. The non-irrigated acreage in

the southwest increased from a few thousand acres in 1934 to 60,000 acres or more in 1940.

Wheat—Production of all wheat totalled 12,354,000 bushels compared with 12,064,000 bushels harvested in 1939. Inventory value of the 1940 crop was \$7,659,000 and was almost identical with inventory valuation of the smaller 1939 crop. Most of the winter wheat planted in eastern areas in the fall of 1939 was sown in dry soil, and the crop entered the winter with the second lowest condition rating of record. Many fields did not come up until February or March, 1940. A short crop seemed certain early in the season, but good early spring moisture promoted good growth and filling weather was excellent. A crop of 8,845,000 bushels was harvested, compared with 9,701,000 bushels in 1939. Spring wheat plantings were increased sharply compared with the small plantings of 1939 and fair yields were obtained. Production totalled 3,509,000 bushels compared with 2,363,000 bushels, the very short crop of 1939.

Corn—The down trend in corn plantings continued in 1940, and the acreage seeded was less than half the 1932 area. Fair to good yields were obtained, and 1940 production of corn for all purposes totalled 9,774,000 bushels compared with 7,311,000 bushels in 1939. Yield per acre averaged 11.3 bushels, the highest since 1930, and of the 1,018,000 acres planted, 865,000 acres were harvested. The quantity of corn harvested "for grain" in 1940 was estimated at 7,134,000 bushels compared with 5,129,000 bushels in 1939. Inventory value of the total 1940 corn crop was estimated at \$5,962,000 compared with \$4,533,000 for the 1939 crop.

Oats and Barley—Oats production for 1940 was estimated at 4,168,000 bushels against 3,833,000 bushels in 1939. Yield per acre at 27.6 was above average but not unusually high. The inventory value placed on the 1940 oats crop was \$1,417,000 compared with a \$1,380,000 valuation placed on the 1939 crop. The barley crop totalled 10,100,000 bushels compared with 8,022,000 bushels produced in 1939, and was above average. Yield per acre was above average at 20.2. The 1940 crop was inventoried at \$4,242,000 compared with \$3,690,000 for the 1939 crop.

Sorghums—The quantity of grain sorghums harvested "for grain" estimated at 1,662,000 bushels was one of the largest quantities ever produced in the state and was nearly double the 861,000 bushels harvested in 1939. A total of 468,000 acres of grain sorghums was harvested for all uses for which a 3,978,000 bushel crop was estimated. This compared with 1,404,000 total bushels estimated for 1939. A total of 557,000 acres was planted to grain sorghums in 1940 with 384,000 acres planted in 1939. Value placed on the 1940 grain sorghum crop was \$1,591,000 compared with \$786,000, the 1939 crop valuation. Production of sweet sorghum forage in 1940 totalled 351,000 tons compared with 209,000 tons in 1939. Acreage harvested in 1940 was at a high level, being 413,000 against 299,000 in 1939. Most of the sorghums grown in Colorado are grown under dryland conditions in the eastern part of the state. Some irrigated acreage is grown in the Arkansas Valley, and good acre yields are obtained.

All Tame Hay—Production of all tame hay at 1,637,000 tons was not as large as desirable in relation to the livestock inventory but was significantly larger than the short 1939 crop of 1,483,000 tons and was moderately below the 10-year average. Clover and timothy hay yields were good in the North Park area and in the northwest, and production of millet and sudan hay in eastern areas was much larger in 1940 than in 1939. Value per ton of hay from the 1940 crop was materially lower than per ton valuations maintained for the 1939 crop, when hay prices were at a premium in some areas. Total value of the 1940 crop was \$12,605,000 compared with \$13,495,000 for the 1939 crop.

Alfalfa—An alfalfa crop of 1,196,000 tons (included in All Tame Hay) was harvested in 1940. This compared with 1,128,000 tons, the short crop of 1939. Yields were low in the San Luis Valley, the lower Arkansas Valley, and in the Larimer County area of northern Colorado, but were fair to good elsewhere in the state. September rains produced a good late cutting.

Wild Hay—Wild hay production was short again in 1940 with a crop of only 285,000 tons, compared with 297,000 tons in 1939. Low yields were obtained in the middle mountain area and in the San Luis Valley, and considerable acreage here and there in wild hay producing sections was not cut. Only 356,000 acres were cut in 1940, while in 1939, 371,000 acres were harvested. Shortage of hay in the San Luis Valley necessitated close selling of breeding stock and movement of some sheep bands elsewhere for wintering. Yields were good in the North Park area and in the northwest. The 1940 wild hay crop was valued at \$2,223,000 compared with \$2,524,000 for the smaller 1939 crop.

Broomcorn—Production in 1940 was estimated at 7,800 tons and was much the largest crop harvested in Colorado since 1931. The 1939 crop was relatively small at 3,700 tons. Prices received by growers for the 1940 crop averaged \$55 per ton and were much below the \$97 average received for the short 1939 crop. The high prices received in 1939 resulted from a short crop, both in Colorado and the United States. The 1940 crop, however, returned \$429,000 to growers, while the 1939 crop returned only \$359,000.

During the 1927 to 1932 period, Colorado ranked high among the states as a producer of broomcorn. In 1930, the state produced 10,400 tons. Baca County, located in the southeastern corner of the state, produces the bulk of the Colorado crop. Rainfall and growing conditions generally continued unfavorable in most of the years following 1932, but during 1940, growing conditions were fairly satisfactory and an average yield of 250 pounds per acre was secured. This yield was much above the yields obtained in a number of years preceding 1940 but was still somewhat below the yields obtained in most years prior to 1932. Most of the broomcorn grown in Colorado is of the "standard" variety.

Field Peas—The acreage of field peas grown for all purposes remained at a low level in 1940, the area harvested being 34,000 acres. Much of this acreage is harvested for hay or grazed off in the field. Only 20,000 acres were harvested for grain in 1940, while in 1939, 12,000 acres were harvested and threshed. Production from this acreage was 260,000 bushels in 1940 and 180,000 bushels in 1939. The San Luis Valley, located in south central Colorado, produces most of Colorado's field pea crop. A minor producing area is located in Chaffee County. Most of the field peas grown in Colorado are of the White Canada variety, but substantial quantities of Black Eyes are also produced. Other varieties include Warshauer and "First and Best," both of which are strains of the White Canada variety.

FRUIT

(Unrevised Estimates)

Apples—A commercial apple crop of 1,564,000 bushels was produced in 1940, which compared with the very short crop of 1,058,000 bushels produced in 1939. Much of the increased production in 1940 was in Delta County and tributary western Colorado areas where the crop was very short in 1939. The crop in Fremont County was almost a total loss due to a severe April freeze, and the northern Colorado crop was also small for this reason. The 1940 commercial crop was valued at \$1,040,000 compared with \$698,000 for the short 1939 crop. Delta County is the principal carlot shipping area, while the apples from other areas move to market principally by truck. A total of 712 cars were shipped from the 1940 crop, in sharp contrast to the small carloadings of 234 cars from the 1939 crop. Shipments by truck from the 1940 crop amounted to 30,200,000 pounds, compared with 23,800,000 pounds from the 1939 crop.

Apples produced in Colorado are of excellent quality, flavor, and color. The commercial industry is concentrated in a few counties. Delta County on the Western Slope has nearly one-half the apple trees in the state. Fremont County ranks second in number of trees, but many of the orchards in this county are small, and some have been badly neglected. Montezuma County, in southwest Colorado, is third in number of trees and produces many commercial apples. Larimer County in northern Colorado is also important in the production of commercial apples from orchards in the vicinity of Fort Collins. Other counties important in apple production are Mesa, Montrose and Garfield, in western Colorado, and Boulder and Jefferson, north and west of Denver.

Peaches—The year 1940 set a new all-time record with a crop of 2,000,000 bushels. The previous high record was established in 1938 with 1,634,000 bushels, while 1939 production totalled 1,575,000 bushels. Quality of the 1940 crop was excellent, and prices received by growers generally satisfactory, averaging 90 cents per bushel. Total value of the 1940 crop was \$1,746,000 compared with \$1,260,000, the 1939 crop valuation. A total of 2,409 cars of peaches were shipped in 1940, compared with 1,630 cars in 1939. Truck shipments totalled 24,000,000 pounds in 1940 and 18,000,000 pounds in 1939.

The peach industry in Colorado is rather unique in that the orchards are concentrated in two distinct areas and the fact that the entire crop moves to market in the short period of approximately six weeks in August and September. During this time, Colorado peaches dominate the market supply in many consuming centers throughout the country.

About three-fourths of the trees are located in Mesa County of western Colorado. In this county most of the trees are located on the Orchard Mesa near Palisade and Grand Junction. The balance of the commercial crop is grown in Delta County in areas near the towns of Cedaredge, Paonia, and Hotchkiss. Climate, soil, and air-drainage are favorable for peach production in all these sections, and water for irrigation is abundant. In recent years many trees infected with mosaic have been removed, but these removals have been more than offset by replacement plantings and plantings of additional new orchards. Production appears to be on the uptrend, as new trees are coming into bearing each year.

Pears—The year 1940 was fairly favorable for pears, and a crop of 249,000 bushels was harvested, compared with the short 1939 crop of 173,000 bushels. The 1940 crop was valued at \$187,000 compared with \$130,000 for the 1939 crop. Pear production was of more importance in Colorado during the period 1920 to 1929, when crops of 500,000 to 600,000 bushels were produced annually. In recent years many trees have been pulled, and production has ranged between 200,000 and 300,000 bushels. Disease—principally blight—low prices, and the necessity for frequent spraying have been the principal reasons for decreasing the number of trees and consequent lower level of production.

Cherries—The production of cherries of all varieties in 1940 was 4,350 tons, compared with 3,920 tons in 1939. Of the quantity produced in 1940, sour cherries accounted for 4,090 tons and sweet cherries for 260 tons. In 1939, the sour cherry crop was 3,770 tons, and the sweet cherry crop only 150 tons. Sweet cherries are grown mostly in Delta, Garfield and Mesa Counties. The total 1940 cherry crop was valued at \$230,000 against \$201,000 for the 1939 crop.

Many Colorado sour cherries are canned in plants located at Loveland, Fort Collins (near), Canon City, Grand Junction and Delta.

Larimer County ordinarily produces nearly two-thirds of the cherry crop of the state, followed by Fremont, Jefferson, Delta and Mesa Counties in order of importance.

Grapes, Apricots, Plums—Grapes are grown primarily in Mesa, Delta, Fremont, and Garfield Counties and also in the area tributary to Denver. In 1940, 770 tons of grapes were harvested compared with 500 tons in 1939. Plums are also grown in these counties but on a relatively small scale. Apricots are grown in the same two counties which produce peaches on a commercial scale.

Strawberries, Raspberries—These two berry crops and other berries are grown primarily in Jefferson County and in other areas tributary to Denver. A portion of these fine quality berries is shipped to outside markets, but the bulk of them go to supply the Denver market. These small fruits are also produced in some volume in Larimer, Garfield, Fremont, Mesa, and Delta Counties.

TRUCK CROPS (Commercial Vegetables) (Unrevised Estimates)

The acreage of commercial vegetables harvested in 1940 aggregated a little over 64,000 acres and was the largest acreage harvested in recent years. In 1939, a little over 60,000 acres were harvested. The principal crops contributing to the larger acreage in 1940 were green peas, spinach, and cantaloups. Vegetables harvested in 1940 were valued at \$7,040,000 compared with \$6,743,000 for the same crops harvested in 1939. Average value during the 10-year period (1929-38) was \$5,755,000. These commercial vegetables are grown almost entirely in the irrigated areas (see map inside back cover) although some crops such as lettuce and spinach are grown in the northwest and mountain areas without irrigation.

Colorado vegetables are known throughout the country for their quality and flavor. The commercial vegetable industry in the state is an important one as related to the relatively large amount of labor employed on the small acreage, the high gross value of the crops produced, and the high value per acre.

The rank of truck crops in relation to the acreage devoted to each of them is as follows: Green peas, cantaloup and honeydew melons, lettuce, onions (dry), tomatoes, cabbage, snap beans, cauliflower, cucumbers, celery, spinach and carrots. Other vegetables, such as broccoli, egg plant, peppers, turnips, radishes, and green onions, and, in fact, practically all of the common garden vegetables, are grown somewhere in Colorado. The quantity of these vegetables in the second group is rather small and most of them are consumed locally, but parts of these crops reach markets outside the state through truck or express shipments.

Cantaloups and Honeydew Melons—Production in 1940 at 1,340,000 crates was smaller than the crop of 1,500,000 crates harvested in 1939. Total value was also lower. In most years, the value of these crops exceeds \$1,000,000; however, due to rather low yields and prices, the 1940 crop was valued at only \$817,000.

The Arkansas Valley of southeastern Colorado is the home of the "Rocky Ford" cantaloup. These melons have a nation-wide reputation for their splendid quality and flavor. Continued use of improved strains has increased the quality of this production in recent years. "Vine ripening" and "pre-cooling" before shipment have permitted placing of Colorado cantaloups on consumers' tables in recent years with even better quality and flavor than formerly.

The proportion of honeydew melons has increased greatly in recent years, and a substantial percentage of these melons is also "vine ripened" and "pre-cooled" before shipment. In most years quality and flavor are excellent. There are occasions, however, when quality is not fully under grower or shipper control. Such natural hazards as hail, excessive rainfall, and insect injury occasionally reduce quality and appearance. On the whole, however, consumers can continue to look to Colorado for even better quality melons in the future than they have been receiving in the past.

Counties which lead in production are Crowley, Otero, Pueblo, Bent, Adams, Weld and Mesa.

Green Peas—Production of green peas for market in 1940 totalled 1,600,000 bushels compared with 1,188,000 bushels harvested in 1939. The acreage of peas grown for the fresh market has been on a general up trend in recent years. The San Luis Valley of south central Colorado produces a large percentage of the green pea crop. In 1940, however, larger acreages were grown in the Arkansas Valley and in the lower western valleys than in years previous. A total of 16,000 acres of green peas was grown for the fresh market in 1940 compared with 13,200 acres in 1939. The acreage of green peas grown for canning is also fairly large and totalled 3,800 acres in 1940 compared with 3,250 acres in 1939. Most of the acreage is grown in northern Colorado tributary to Fort Lupton and Brighton. The total green pea crop was valued at \$1,402,000 in 1940 compared with \$988,000 in 1939. Principal producing counties are Conejos and Costilla Counties in the San Luis Valley, where the bulk of the crop is shipped fresh. Production in Boulder and Larimer Counties of northern Colorado is largely canned.

Cabbage—The acreage of cabbage harvested in 1940 is placed at 4,400 acres compared with 4,650 acres harvested in 1939. Due to unusually low prices, the crop was valued at only \$344,000 in 1940 compared with \$644,000 for the 1939 crop. Some good quality cabbage wasted in the field because market prices were unusually low at the time the crop was ready for harvest.

Cabbage of the Early Domestic type supplies the summer market beginning in July, while the Late Danish type supplies the fall and winter market. The bulk of the crop is produced in Weld, Adams, and Costilla Counties. A small quantity is canned as kraut each year. Quality and flavor of Colorado cabbage are excellent.

Cauliflower—The season of 1940 was generally favorable for cauliflower, and yield and quality, for the most part, were good. Frost was later than usual in the San Luis Valley which permitted harvesting more than the usual amount of cauliflower from late-maturing fields and shipments during October were large in comparison with those of a number of years preceding. The San Luis Valley crop has been marketed under terms of a marketing agreement entered into by growers and dealers. This agreement, for the most part, has operated satisfactorily and acreage has increased moderately, totalling 3,700 acres in 1940, the largest acreage harvested since 1931. The 1940 crop was valued at \$388,000 compared with \$259,000 for the 1939 crop.

The bulk of the crop is grown in Costilla and Conejos Counties in the San Luis Valley and at an elevation of 7,500 feet above sea level. Costilla County is one of the leading counties in the United States in the production of cauliflower, and production from this area dominates the late summer and early fall market. Pueblo, Adams, and Fremont Counties also grow this crop in considerable volume.

Tomatoes—Tomatoes were grown in 1940 on 5,100 acres, of which 2,700 acres were grown for canning and 2,400 acres for the fresh market. The total crop of 1940 was valued at \$506,000 compared with \$476,000 for the 1939 crop.

The acreage grown for processing is canned as both juice and fruit. Much of the acreage grown in the Arkansas Valley is canned, and this is also true of

the crop grown in Weld, Adams, and Mesa Counties. Harvest begins in August and continues until frost. Due to abundant sunshine and the varieties grown, these tomatoes produce an unusually fine pack. Fresh tomatoes trucked and shipped by rail from Colorado are a pleasing product in the consuming markets.

Celery—Production in 1940 totalled 426,000 crates. This was the largest crop ever harvested in the state and compared with 359,000 crates in 1939. Prices were fairly satisfactory, and the crop grossed \$1,129,000, about the same as in 1939. The acreage has increased steadily in recent years, and 1,520 acres were harvested in 1940.

Colorado giant and short strain pascal celery enjoys a national reputation.

A large percentage of the crop is grown immediately north and west of Denver in Jefferson and Adams Counties. Minor producing areas are in the vicinity of Canon City and just east of Pueblo. Small quantities are also grown in Otero County and in several counties on the Western Slope.

A large percentage of Colorado celery is wrapped with paper for bleaching in the field and is then placed in trenches for further bleaching and storing for the Thanksgiving and Christmas markets. Trenched celery has a quality and flavor not exceeded anywhere. In recent years much Colorado celery has been shipped in individual gift packages during the holiday season. Only a small portion of the crop moves in carloads, but shipments in less than carloads by express go to all parts of the country and additional quantities move by truck. While the cost per acre of producing celery is large the average value of the crop is usually the highest for any crop grown in the state. In some years the value per acre has exceeded \$500.

Certified Seed Potatoes—Colorado ranked fifth among the states of the country as a producer of certified seed potatoes in 1940 after having ranked fourth in each of the years 1938 and 1939. This drop in rank occurred in spite of the fact that 1940 production of 837,000 bushels was the largest ever produced in the state, being approximated only by the 1939 crop of 707,000 bushels. Production in Nebraska was unusually large in 1940, and Nebraska moved into fourth place with a crop of 1,007,000 bushels. Maine is the large producer of certified potato seed in the United States with a 1940 crop of 8,466,000 bushels, followed by North Dakota with a crop of 2,208,000 bushels and Minnesota with 1,954,000 bushels in 1940.

Not all the certified seed produced in Colorado is used by potato growers within the state's borders. A portion of the crop is shipped to other states. Although production has been on the up-trend in recent years, production in 1940, if all used by Colorado growers, would have been sufficient to seed only a little over one-third of the commercial acreage planted in the state.

About one-third of the crop produced in 1940 for certification was of the Red McClure variety, and most of this crop was grown in Rio Grande County. The variety next in importance was Bliss Triumph, followed by Irish Cobbler. Production of each of these varieties was larger in 1940 than in 1939. Production of Katahdin, Rural New Yorker, White Rose, and Russet Burbank varieties was also significantly larger; while production of Peachblows and Brown Beauties was smaller. Weld and Sedgwick Counties are the principal producers of the Bliss Triumph variety, while these two counties, along with Dolores County, produce most of the Irish Cobblers. Weld County is also the principal producer of Katahdins (see index for reference to county table on certified seed potatoes).

REVIEW OF THE 1941 CROP SEASON

(PRELIMINARY ESTIMATES)

The aggregate production of Colorado field crops in 1941 was much larger than production in 1940 and was above the average of several years preceding 1940. Production of the three important cash crops—sugar beets, potatoes, and beans—however, was smaller in 1941 than in 1940 as a result of reduced acreage and yield per acre moderately lower in 1941 than in 1940. Crops making an exceptionally good showing during the year were wheat, corn, oats, barley, grain sorghums, and hay and forage crops. Production of barley, grain sorghums, and forage sorghums was the largest of record. The 1941 wheat crop was the second largest ever produced in the state, while oats production was the largest since 1929. Production of all tame hay was above average, and the tonnage of wild hay was the largest since 1920. Due to the generally favorable growing season, the yield per acre of each field crop was exceptionally good. Abandonment of planted acreage was small, loss being even less than the relatively small abandonment experienced in 1940. The acreage of all crops harvested totalled 6,149,000 acres compared with 5,504,000 acres harvested in 1940 and was the largest since 1931. Fruit crops were smaller in 1941 than in 1940. The spring season was cool and wet. This resulted in seeding of early spring planted crops to be later than usual in some areas. Washing rains in eastern areas made it necessary to replant considerable acreages of row crops, principally corn and sorghums. The supply of irrigation water was adequate throughout the entire season. Rainfall in nearly all parts of the state was above normal for each month from March through October. The months of September and October were very wet, and early frost, together with excessive moisture, reduced yield and quality of corn, sorghums, and beans from earlier expectations. Excessive moisture caused harvest to progress with difficulty. Severe hail storms occurred in many parts of the state both early in the spring and during the summer and early fall season, and damage of field, fruit, and vegetable crops was considerable.

Due to higher prices and larger marketings, farm income (including government payments) in 1941 totalled \$171,172,000 compared with \$142,813,000 in 1940 and was the largest since 1929. Sales of cash crops, livestock, and livestock products all contributed to the larger 1941 income.

Potatoes—Production was estimated at 11,968,000 bushels in 1941 compared with 13,936,000 bushels in 1940. Continuing the down-trend which had been under way for a number of years, plantings were again reduced in 1941. Although abandonment was small, only 64,000 acres were harvested, compared with 67,000 acres in 1940. Yield per acre for the state as a whole averaged 187 bushels and was above average but below the record 1940 yield of 208 bushels. Yields were high again in northern Colorado and also on the Western Slope, and the crop turned out exceptionally well in the San Luis Valley considering the short growing season. The early September freeze caused some loss in late fields. Inventory value of the 1941 potato crop was placed at \$6,702,000 compared with \$5,853,000 for the 1940 crop.

Sugar Beets—A crop of 1,901,000 tons was harvested in 1941 compared with 2,092,000 tons in 1940 and 2,141,000 tons the 10-year (1930-39) average. Yield per acre averaged 14.3 tons, the third largest of record, being exceeded only by the 14.6 ton yield secured in 1938 and the record 14.9 ton yield of 1940. While the character of the season in 1941 was greatly different than that experienced in 1940, the relatively high yield obtained was again something of a reflection of the better care, more adequate use of fertilizer, and better land on which the sugar beet acreage was grown. Other contributing factors to the high 1941 yield per acre were the ample supply of irrigation water and the generally favorable weather during the growing season. Of the 135,000 acres planted in 1941, 133,000 acres were harvested. In 1940, plantings totalled 152,000 acres, of which 140,000 acres were harvested.

Beans—A bean crop of 1,621,000 bags of 100 pounds was harvested in 1941 compared with 1,965,000 bags harvested in 1940. Production in each bean-growing area was smaller, but the decline was greatest in the southwestern and east central dryland areas. Plantings were delayed by wet spring weather, and late fields in these areas were damaged considerably by the early September freeze. Heavy late rains reduced quality in all areas. The 1941 crop was inventoried at \$4,771,000 compared with \$4,476,000 for the larger 1940 crop.

Wheat—Production of all wheat totalled 25,036,000 bushels, the second largest crop of record and more than double the 1940 crop of 12,354,000 bushels. Wheat in eastern Colorado was considerably damaged by hail and, to some extent, by excessive moisture after the crop was ready for harvest. Otherwise production would have been larger. Winter wheat was seeded in the fall of 1940 under very favorable soil moisture conditions. Spring rainfall was timely, and filling weather nearly ideal. Prices ruled considerably higher during 1941 than during 1940, and the inventory value placed on the 1941 crop was \$22,682,000 and nearly three times as great as the \$7,695,000 valuation placed on the 1940 crop.

Corn—The 1941 corn crop was the largest harvested in Colorado since 1933. Good yields were obtained in both irrigated and dryland corn producing areas, and 1941 production for all purposes totalled 15,026,000 bushels compared with 9,774,000 bushels in 1940. Total plantings were small again in 1941, continuing the down-trend which has been under way for a number of years, but loss of acreage through abandonment was small and 951,000 acres were harvested compared with 865,000 acres harvested in 1940. The low level of corn acreage in Colorado in recent years has been due to sharp reduction in plantings on non-irrigated land. In recent years, the acreage grown on irrigated land has followed a pronounced up-trend. Corn grown on irrigated land in Colorado usually yields abundantly of both grain and forage. During the last few years, use of hybrid seed has given further encouragement to growing of corn in eastern irrigated areas and in the lower western valleys. The average yield per acre of all corn grown in the state in 1941 was 15.8 bushels, the highest average obtained since 1930. The September freeze was damaging and reduced both yield and quality from earlier expectations. The quantity of corn harvested for grain totalled 12,050,000 bushels in 1941 compared with 7,134,000 bushels in 1940.

Inventory value of all corn in 1941 was \$10,819,000; 1940, \$5,962,000.

Oats and Barley—An oats crop of 5,859,000 bushels was harvested in 1941 compared with 4,168,000 bushels in 1940. The 1941 crop was the largest since 1929, resulting from both a relatively large acreage and above average yield per acre. A bumper crop of barley was produced in Colorado in 1941 totalling 15,372,000 bushels and fully 50 per cent above the rather large 1940 crop of 10,100,000 bushels. Acreage harvested at 610,000 acres was the largest ever cut in Colorado, and yield per acre at 25.2 was much above average but not quite a record. Both irrigated and nonirrigated yields were exceptionally good. Inventory value of the 1941 crop of both oats and barley is placed at \$8,565,000 compared with \$5,659,000 for the 1940 crops.

Sorghums—The crop of grain sorghums harvested "for grain" in 1941 was estimated at 1,984,000 bushels. This was the largest quantity of sorghum grain ever harvested in the state. Production in 1940 totalled 1,662,000 bushels. The quantity of forage from grain sorghums was estimated at 312,000 tons in 1941 compared with 220,000 tons in 1940. Production of sweet sorghum forage in 1941 totalled 481,000 tons compared with 351,000 tons in 1940. Yield and quality of sorghums were reduced by the early September freeze, and considerable spoilage resulted from excessive amounts of fall moisture. This excessive moisture made harvest difficult and this, together with high wages, caused some producers to leave some quantities of sorghums unharvested in the field. Value of all sorghums was estimated at \$4,774,000 in 1941 compared with \$3,311,000 for 1940 production.

All Tame Hay—Tame hay production in 1941 totalled 1,879,000 tons. This was a large crop in relation to production in recent years and was significantly larger than the crops of both 1940 and 1939. In years prior to 1931, tame hay production usually exceeded 2,000,000 tons. Production in each year since 1930 has been less than 2,000,000 tons. The relatively large 1941 tame hay crop coincided with a substantial increase in the inventory numbers of cattle and sheep, with the result that practically all parts of the state had ample hay supplies for the 1941-42 winter feeding season. Value per ton was lower than in 1940, and total value was \$11,838,000 compared with \$12,605,000 for the 1941 crop. Most of the Colorado tame hay leaves the farm "on the hoof" although some quantities are sold for cash to other farmers, ranchers, and feeders, and considerable alfalfa is sold to alfalfa milling plants in the Arkansas Valley.

Alfalfa—The 1941 alfalfa hay crop of 1,363,000 tons (included in all tame hay) was also relatively large in comparison with the crops of recent years. Production in 1940 was estimated at 1,196,000 tons. The first cutting of old stands was damaged considerably by aphid in the Arkansas Valley, and yield of first cutting was also light in the Mesa-Delta County area due to unusual

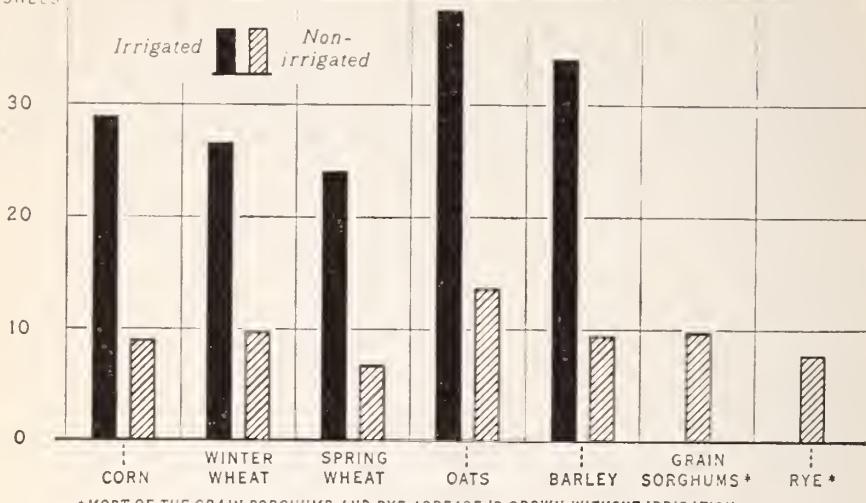

prevalence of weevil, but yield per acre for the entire season was generally above average in all areas. Fall rains reduced quality of the last cutting in eastern areas.

Wild Hay—The 1941 wild hay crop of 431,000 tons was the largest harvested in the state in twenty years. Good early spring and summer moisture supplies resulted in above average yields per acre in all sections of the state. Here also the large production coincided with an increase in the inventory of hay-consuming animals. The large 1941 crop was in sharp contrast to the short 1940 crop of 285,000 tons. The acreage cut in 1941 was also large at 392,000 acres which compared with 356,000 acres cut in 1940. Value of wild hay was placed at \$2,672,000 against \$2,223,000 for the 1940 crop.

IRRIGATION IN COLORADO

Colorado ranks second among the states in the country in number of acres under irrigation. With approximately 3,400,000 acres irrigated, Colorado is exceeded only by California. The effect of irrigation upon crop yields in the state is well illustrated by the chart on this page. This reveals for the crops shown, that irrigated yields per acre are approximately three times those obtained without irrigation. Although soil, the amount of natural moisture, the section of the state in which the crops are grown, and other factors affect yields, the supplying of sufficient moisture is the principal factor which determines yield per acre. Irrigation eliminates much of the hazard which attends crop production in the semi-arid portions of the United States. The average yield per acre of corn grown under irrigation in Colorado during the ten years 1928 to 1937 ranged between 25 and 40 bushels per acre (1934 excepted) and averaged 29.0 bushels. Winter wheat yields ranged between 22 and 34 bushels and averaged 26.6 bushels per acre. Spring wheat had a range of from 22 to 30 bushels with an average of 24.0 bushels. Oats ranged between 36 and 42 bushels per acre and averaged 38.4 bushels. Barley yields ranged between 31 and 39 bushels per acre and averaged 34.1 bushels. These figures are averages for the state as a whole. Many individual farmers obtained yields of each of these crops much in excess of these averages. During the same ten-year period quoted above the highest average yields obtained for any of these crops grown without irrigation was 21 bushels per acre. Both corn and oats made this average in 1930.

Good yields are obtained from dry edible beans grown under irrigation. During the ten years 1928 to 1937 bean yields ranged between 700 and 1,080 pounds per acre and averaged 777 pounds per acre. Potatoes respond well to irrigation and yields usually average above 150 bushels per acre. In 1930 the state average was 200 bushels per acre. Sugar beets also thrive in Colorado climate and the many days of fall sunshine provide relatively high sugar content. Average yields range between 11.3 and 13.7 tons per acre and usually exceed 12.5 tons and are among the highest obtained in the United States.

Over 90 per cent of the Colorado alfalfa acreage is grown under irrigation and yields averaged 1.9 tons per acre during the ten years, 1928 to 1937. A large percentage of the wild hay acreage is irrigated and yields usually exceed one ton per acre.

In recent years there has been an up trend in the irrigated acreage of corn, beans, wheat, oats and barley. The trend of the irrigated acreage of sugar beets and alfalfa has been down.

LIVESTOCK INVENTORY AND VALUE

JANUARY 1, 1941 AND 1940

The total inventory value of all livestock (including chickens) on Colorado farms January 1, 1941 was \$93,932,000 compared with \$88,236,000 on January 1, 1940. This was an increase of 6 per cent. The value January 1, 1941 was the highest since that date in 1937. During the year 1941, the number of beef cattle increased about 40,000 head, while the number of milk cows increased slightly. The number of stock sheep declined moderately, and there was a significantly smaller number of sheep and lambs on feed January 1, 1941 compared with 1940. Hog numbers decreased 20 per cent during 1940. The number of chickens declined moderately, and horse numbers showed a decrease of 4 per cent. The number of mules was unchanged. The reduction of the number of lambs on feed was partly the result of short feed supplies in certain feeding areas, while the sharp reduction in the number of hogs was mainly caused by the unfavorable feeding relationship which maintained during 1940 between hog prices and feed prices. On the other hand, higher per head valuations and larger hay supplies in 1940 than in 1939 encouraged cattlemen to hold back young breeding stock. With the exception of horses and mules, the value per head of all species of livestock was higher on January 1, 1941 than on January 1, 1940.

All Cattle—The number of all cattle and calves on farms January 1, 1941 was placed at 1,442,000 head compared with 1,400,000 head January 1, 1940 and on January 1, 1939. The number of steers showed a slight decline, while the number of cows, heifers, and calves increased during 1940. The total value of all cattle on January 1, 1941 was placed at \$60,716,000 which compared with a \$53,340,000 valuation a year earlier. The average value per head increased from \$38.10 to \$42.10 during 1940.

Milk Cows—The number of milk cows increased slightly and at 237,000 head, compared with 235,000 head on January 1, 1940 and this same number on January 1, 1939. The value per head of milk cows at \$57.00 was up \$5.00 from the January 1, 1940 level, and total value increased from \$12,220,000 to \$13,509,000. Value per head of milk cows January 1, 1940 was the highest since 1930.

Sheep—The number of stock sheep January 1, 1941 placed at 1,717,000 head compared with 1,752,000 January 1, 1940 and represented a decline of 2 per cent. More ewes were marketed during 1940 than during 1939, and somewhat fewer ewe lambs were held back for replacement purposes. Sheep and lambs on feed for market totalled 865,000 head compared with 925,000 head January 1, 1940, and the 1941 number was the second smallest number on feed of record. The average value per head of all stock sheep and lambs January 1, 1941 was \$7.60 compared with \$7.20 a year earlier, and the total value January 1, 1941 was \$13,049,000 compared with \$12,614,000 January 1, 1940.

Hogs—There was a sharp decrease in the number of hogs during 1940, and inventory numbers declined from 385,000 head January 1, 1940 to 308,000 head January 1, 1941. Although the value per head January 1, 1941 at \$6.90 was 60 cents higher than on January 1, 1940 hog prices during 1940 were unfavorable for hog production, and fewer pigs were raised in 1940 than in 1939. The inventory value of hogs January 1, 1941 was \$2,139,000 compared with \$2,426,000 January 1, 1940 and \$2,888,000 January 1, 1939.

Horses—The number of horses continued to decline during 1940, and the number January 1, 1941, estimated at 213,000 head, was 9,000 head smaller than a year earlier. Horse numbers in Colorado have declined nearly 50 per cent since 1919, when the State had 440,000 head of horses on farms January 1 of that year. The value per head January 1, 1941 at \$46.00 was down \$6.00 from a year earlier. Total value January 1, 1941 declined to \$9,830,000 from \$11,544,000 January 1, 1940.

Mules—Mules of all ages on farms January 1, 1941 totalled 13,000 head and was unchanged during 1940. Value per head decreased during 1940 from \$71.00 to \$67.00, and total value decreased from \$923,000 to \$868,000.

Chickens—Number of chickens on farms January 1, 1941 totalled 3,319,000 birds, and represented a decline of about 5 per cent from the January 1, 1940 total of 3,609,000 birds, and was considerably below the 10-year average inventory. Although the number of chickens decreased, the January 1, 1941 value per bird at 55 cents was 5 cents per bird higher than on January 1, 1940. Total value January 1, 1941 was \$1,825,000 compared with \$1,804,000 a year earlier.

JANUARY 1, 1942 AND 1941

The inventory value of all livestock (including chickens) on Colorado farms January 1, 1942, was \$131,127,000, compared with \$93,932,000 on January 1, 1941. This was an increase of \$37,195,000 or 40 per cent, and was much the highest inventory value placed on Colorado livestock since January 1, 1929, when the value totalled \$137,916,000. The number of all cattle and calves was 10 per cent larger January 1, 1942 than on January 1, 1941, but due to higher values per head, the total value was 41 per cent higher. There was a 3 per cent increase in the number of cows and heifers kept for milk and total value was 30 per cent higher. Hog numbers increased 23 per cent during 1941, and total value January 1, 1942 was 171 per cent higher than a year earlier. The number of stock sheep was up 3 per cent, and total value was about 31 per cent higher. There was a 29 per cent increase in the number of sheep and lambs on feed. Chicken numbers were up 13 per cent, and the total value was up 52 per cent from the January 1, 1941, valuation. Horse and mule numbers were smaller, and total value moderately lower. Hay and feed supplies were adequate in practically all areas, and although weather during the winter of 1941-42 was severe, livestock generally wintered in good condition. The larger January 1, 1942 livestock inventory numbers compared with a year earlier were definitely a reflection of aggressive efforts on the part of Colorado farmers and stockmen to increase food production for war purposes, and foretold larger marketings and slaughter of meat-producing animals in 1942 compared with 1941.

All Cattle—The number of all cattle and calves on farms January 1, 1942 was placed at 1,586,000 compared with 1,442,000 January 1, 1941, and was the largest number inventoried since 1935. Each age and sex group of cattle was larger, but the increase in beef cows was pronounced, and the number of steers was significantly larger, reflecting the larger number of these animals in feed lots. The inventory value of all cattle and calves was estimated at \$85,622,000, compared with \$60,716,000 a year earlier. Per head valuation increased from \$42.10 to \$54.00 during 1941.

Milk Cows—The number of cows and heifers two years old and over being kept for milking purposes showed an increase of 3 per cent, or from 237,000 to 244,000 head. The value per head of milk cows at \$72.00 was up \$15.00 from January 1, 1941. Total value increased from \$13,509,000 to \$17,568,000. Value per head of milk cows January 1, 1942 was the highest since 1930. The increase in inventory numbers was not outstanding considering the extent to which increased milk production is desired in 1942; however, Colorado farmers are feeding much larger quantities of grain to milk cows in 1942 than was fed during 1941 in an effort to stimulate milk flow.

Sheep—The number of stock sheep at 1,769,000 head January 1, 1942 compared with 1,717,000 head a year earlier. The January 1, 1942 inventory was the largest since 1934 and was above the 10-year average. More ewe lambs were held over in 1941 than were held from the 1940 lamb crop. Ewe bands wintered well, feed supplies were adequate, and indications are that the lamb crop of 1942 may compare favorably with 1941 crop. Sheep and lambs in feed lots January 1, 1942 totalled 1,115,000 head, compared with 865,000 head a year previous. The average value per head of stock sheep and lambs January 1, 1942 was \$9.70 compared with \$7.60 a year earlier. Total value of stock sheep and lambs was \$17,159,000 compared with \$13,049,000 in January, 1941.

Hogs—Hog numbers increased sharply during 1941, principally due to a large increase in the 1941 fall pig crop. The number of all hogs January 1, 1942, totalled 379,000 head, compared with 308,000 a year earlier. Hogs under 6 months of age accounted for an unusually large percentage of the January 1, 1942 inventory, with hogs over 6 months of age available for marketing accounting for an unusually small percentage. Value per head was more than double that of a year earlier, being \$15.30 compared with \$6.90, and was the highest value since 1927. Total value was \$5,795,000 compared with \$2,139,000 January 1, 1941.

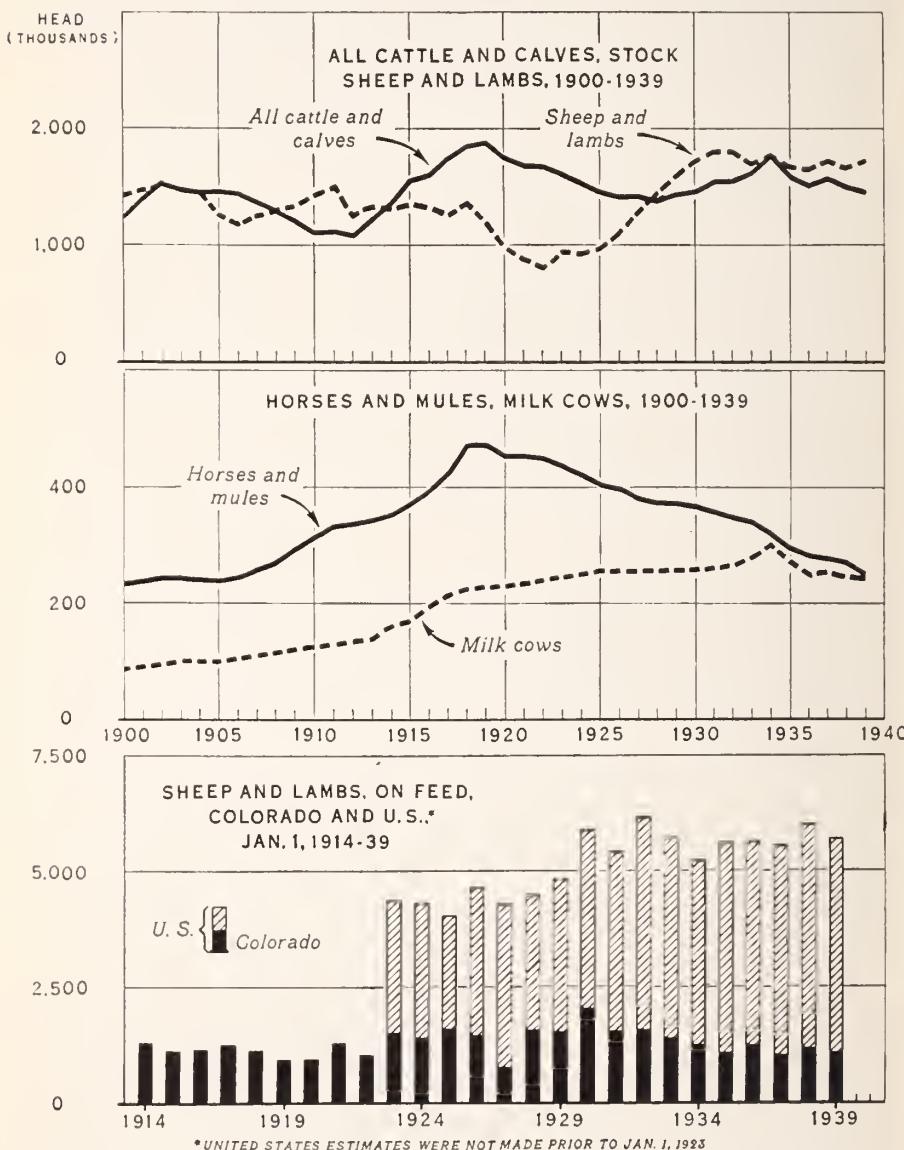

Horses and Mules—Horse numbers continued the decline which had been under way for 22 years. The January 1, 1942 inventory totalled 207,000 head compared with 213,000 head a year earlier and was less than half the 440,000 head on Colorado farms January 1, 1919. Value per head at \$47 changed only slightly during 1941. The total value January 1, 1942 was \$9,756,000 against \$9,830,000 a year earlier. Mule numbers were also at a low level, totalling only 12,000 head compared with 13,000 a year previous. Value of mules per head at \$66.00 was little changed from a year previous.

Chickens—The number of chickens on Colorado farms increased from 3,319,000 January 1, 1941 to 3,752,000 January 1, 1942. There was a pronounced increase in the number of pullets being saved for layers, with only a moderate carry-over of old hens. Chicken values rose sharply during 1941 and January 1, 1942 numbers averaged 74 cents per bird, compared with 55 cents for preceding year's inventory. Total value January this year was \$2,776,000, last year \$1,825,000.

Turkeys—Turkeys on hand January 1, 1942 totalled 229,000, compared with 176,000 a year earlier, an increase of 30 per cent. The value of birds on hand January 1, 1942 was \$710,000 compared with \$370,000 January 1, 1941.

F. K. REED,
Agricultural Statistician.

THE HOW, WHY, AND WHEN OF CROP AND LIVESTOCK REPORTS

(and Agricultural Statistics Generally)

HOW

Reports of the Colorado Cooperative Crop and Livestock Reporting Service make available to farmers and the public as a whole the up-to-date facts of Colorado agriculture. These facts, as near as it is humanly possible to determine them, are made quickly available. The program for crops includes forecasts of probable production several months in advance of harvest, a preliminary report at, or immediately following, harvest, and a final report toward the close of the calendar year. The procedure followed in making these forecasts and estimates is briefly: (1) Determination of the changes in acreage which have occurred; (2) Interpretation of condition of the growing crop in percentage of normal to a probable yield per acre. This interpretation is made through a study of the relationships which have maintained between condition of the growing crop and final yield per acre in previous years; (3) Estimated acreage multiplied by interpreted probable yield per acre gives indicated probable quantity production. In the field of livestock reporting, the size of the lamb crop is determined in July, fully two months before these animals begin to move to market in volume. Here again, the one, two, three procedure is followed: (1) An estimate of the number of ewes of breeding age; (2) Number of lambs docked or saved per hundred ewes; (3) Number of ewes of breeding age multiplied by number of lambs saved per 100 ewes gives the total number of lambs saved. The program of pig surveys, to put it humorously makes it possible to anticipate what mamma pigs have in mind in the way of changes in the size of the family several months in advance of the actual birthdays. This information, in turn, permits forecasting, with a serviceable degree of accuracy, the changes which will occur in hog marketings nearly one year in advance of actual marketing. Farm reports of "intentions to breed" form the basis for these forecasts. Actual estimates of the size of the pig crops are subsequently made, again using the one, two, three technique, but, in this case: (1) Is the estimated number of sows which gave birth to pigs during a specified period of time; (2) The average number of pigs saved per litter, and (3) Sows times pigs equals the total pig crop for the specified period. The seasonal changes in milk flow and egg production are determined around the calendar year, using the same one, two, three procedure.

The above illustrations merely highlight the methods used and describe the procedures in very simple terms. In actual practice, the procedure is not so simple, but varies greatly, and is frequently rather complicated, depending upon the problem involved and the result required. In other words, a true determination of the changes which have occurred depends on careful compilation and analysis of the "samples" which have been obtained through the corps of public-spirited farmer correspondents and other correspondents of the United States Agricultural Marketing Service and the Colorado State Planning Commission. These "sample data" are supplemented by information obtained through first-hand observation by the statisticians and other sources. Use of "sample data" to determine changes which have occurred, or are to occur, within an entire field of interest is not new nor is application of this procedure by any means confined to the crop and livestock reporting field of endeavor. To illustrate: if one interested in the physical characteristics of men in the United States wished to determine the average height of all men in the country, he would not need to measure the height of every man in the country. He would need only to measure the actual height of a representative group of these men. That is, tall men, short men, medium sized men, etc. Similarly, the Crop and Livestock Reporting Service does not need a report on the condition of crops growing on every field in the state. But, rather, it needs only the considered judgment of its selected group of crop correspondents. A forester who wishes to determine the number of board feet of lumber in a given tract of timber does not measure every tree in the tract, but makes sample measurements of a selected representative area. He is thereby enabled to determine with a serviceable degree of accuracy the number of board feet of lumber in the entire tract. Changes in crop acreages and changes in livestock numbers for the entire state of Colorado are similarly determined by obtaining through mailed schedules of inquiry a "sample" of the changes which are planned or have taken place on a representative group of farms. Use of this sampling technique has two outstanding advan-

tages: (1) It is small in cost; (2) It makes the facts of agriculture available quickly and currently. The Bureau of the Census makes a complete farm by farm enumeration every 5 years. It requires about 2 years from the time an enumeration is initiated until the final results for the country as a whole are ready for release. Through use of the sampling technique and the ready response of its corps of farmer correspondents, the Crop and Livestock Reporting Service performs these operations for many of its reports within a period of 2 weeks.

Organization of the Colorado Crop and Livestock Reporting Service

Formal cooperation in crop and livestock reporting between the agencies of the State and Federal Governments has been operative in Colorado for more than 20 years. The first agreement between the United States Bureau of Crop Estimates and the Colorado Board of Immigration was subscribed by its farsighted Commissioner, Edward D. Foster, on April 30, 1919. Although this original agreement has been amended from time to time since that date, as demands and occasions required, its operation has always been cordial and effective. In the early twenties, the Bureau of Crop Estimates became a part of the United States Bureau of Agricultural Economics as the Division of Crop and Livestock Estimates. In 1939, the federal agency became a part of the Agricultural Marketing Service as the Agricultural Statistics Division. In 1935, a wise Colorado Legislature, recognizing the need for additional and more accurate county data regarding Colorado agriculture, made a specific cash appropriation for use in carrying out the program of the Cooperative Crop and Livestock Reporting Service. These funds made available more state-paid clerical assistance and travel funds and made possible publication of additional data regarding Colorado agriculture not previously published. This same State Legislature transferred all the functions of the Board of Immigration to a newly created Colorado State Planning Commission. Prior to 1935, this statistical bulletin was published as a part of the Colorado Year Book and a statistical pamphlet giving county agricultural statistics was issued as an annual separate. Beginning with 1935, the data on agricultural statistics were eliminated from the year book and a statistical bulletin, like the one of which this text is a part, was issued as a supplement.

Cooperation between state and Federal agencies in crop and livestock reporting work is a "natural." Both agencies benefit from an administrative standpoint and the public benefits through better and more complete coverage of the statistical side of the agriculture of the state. The agreement makes available to the state agency all the data of the Federal Government and makes available to the Federal agency the data obtained through the operation of the statutes of the state dealing with gathering agricultural statistics.

County Assessors Make Important Contribution

The statutes of Colorado, as originally enacted, required assessors and their deputies to personally visit farm operators to list personal property for taxation purposes. About 20 years ago, these statutes were amended, making it a requirement of county assessors and their deputies to enumerate crop acreages and other items dealing with the statistical side of the agriculture of the state as they visited farms in their counties for the purpose of listing personal property. This requirement made these county agricultural data available at small cost, as it eliminated the necessity for setting up an extensive separate agency to obtain this information. For nearly 20 years the assessors in most Colorado counties have made creditable enumerations. This early provision for obtaining these data on a county basis was a wise one. These data are now available by counties over this period of years. Had they not been determined currently, such a record would not have been available now for proper appraisal of the agricultural industry in each county. The acreage data obtained by assessors, together with yield per acre data furnished by crop correspondents, is made available for public use in the pages of this publication. These data have proved invaluable as foundation material for use in determining the economic feasibility of such important projects as the Grand Lake-Big Thompson Water Diversion Project now under construction. Numerous other economic studies of the drainage basins of the several interstate and international streams which have their headwaters in Colorado have made extensive use of these county data. These data also have been used in the past, and are being extensively used currently, by numerous agencies of State and Federal Governments. They are also extensively used by colleges and public schools.

WHY

Crop Reporting Is Not New—The year 1938 marked the 75th anniversary of crop reporting in the United States. The program was inaugurated in 1863 under the direction of Isaac Newton, Commissioner of Agriculture in the Cabinet of President Abraham Lincoln. It was not as late as 1863, however, that a need for crop information in advance of harvest was recognized by the farmers of the country. In the year 1839, Mr. James T. Earle, then President of the Maryland Agricultural Society, complained that farmers were concerned about the profits that were being made by the dealers and speculators through the circulation of misleading reports on crop production. The subject of obtaining adequate and accurate information regarding crop conditions before the crops had gone to market was discussed. Later, Mr. Earle enlisted the aid of the presidents of agricultural societies in other states.

The occasion of the 75th anniversary of the inauguration of crop reporting was celebrated with an appropriate radio broadcast from Washington as a part of the National Farm and Home Hour in May, 1938. During this broadcast, the history of the development of crop reporting was briefly reviewed and honors done to crop correspondents past and present who gave, and are giving, unsparingly of their time without compensation to aid in making the facts of agriculture available. Particular tribute was paid to the families of those correspondents who had served in this capacity for several generations. One of Commissioner Newton's statements regarding the need for crop reports was read. This quotation is, in part, as follows: "Ignorance of the state of our crops invariably leads to speculation, in which oftentimes the farmer does not obtain just prices and by which the consumer is not benefited . . . the relations between agriculture, manufacturers, and commerce demand that something should be done to obtain, and publish, at brief intervals during the crop season, reliable information of the amount and condition of these crops . . . the connection between the industrial pursuits creates mutual interest. There is no clearer principle of political economy than this, that as the farmer is enriched all other classes prosper." Commissioner Newton's statement regarding the need for adequate information regarding crop conditions and production is just as true today as it was then. The crop reporting system which he began has developed through the years into an indispensable service. Yet, curiously enough, there are still a few farmers and people in other walks of life who sincerely believe that crop reporting is harmful and should be eliminated. Fortunately, these views are held by only a few.

Civilization and education represent an accumulation of human experience. Judgment regarding any matter is based upon analysis and conclusions drawn from the information available. Obviously, judgment can be no better than the information upon which it is based. It follows logically, therefore, that farmers and others concerned with the agricultural industry can come to better conclusions regarding production and marketing plans if they have accurate and adequate information. Industrial concerns and manufacturers spend large sums annually to determine the facts regarding their industries. It is equally important for the agricultural industry, in its many branches, to have adequate information as a basis for better judgment and better planning. The uses of crop and livestock information are legion. Some of these are set forth in outline form in the last 2 pages of this bulletin.

FLOYD K. REED,
Agricultural Statistician.

WHEN

The program of reports of the Crop Reporting Service is a complete one. In general, these reports follow the seasons and give information regarding each crop and class of livestock as it becomes seasonally important. These reports might be roughly classified as those covering: (1) Field crops, such as wheat, corn, hay, potatoes, sugar beets, etc.; (2) fruit crops; (3) truck crops (commercial vegetables), such as cabbage, onions, celery, etc.; (4) livestock inventory; (5) lamb and pig crops; (6) monthly condition of livestock and ranges, and (7) miscellaneous reports. Prices paid to farmers, at country points, for all agricultural commodities are obtained about the middle of each month. The program includes also a quarterly record of the prices which farmers pay for commodities used in farm production and in the farm family living (such as building materials, farm implements, clothing, food, etc.).

During each calendar year, 180 survey schedules are prepared and approximately 225,000 copies are mailed. Those schedules, which are returned, are edited and tabulated. These tabulations are added, computed, weighted, and the results are analyzed and interpreted. Approximately 115,000 copies of the reports prepared from these surveys are mailed each year to crop and livestock reporters and others in Colorado and to persons and organizations in all parts of the country who are interested in Colorado agriculture.

The program of reports issued is presented chronologically in the outline below.

CROP REPORTS (Including field crops and fruit)

January	Stocks of corn, wheat, oats, potatoes, and onions on farms as of January 1. Stocks of wheat in country mills and elevators, January 1. Wages being paid to hired farm labor.
February
March	Acreage of spring field crops which farmers intend to plant. Intended plantings of cabbage and onions.
April	Stocks of corn, wheat, and oats on farms April 1. Stocks of wheat in country mills and elevators, April 1. Condition of winter wheat, rye, and pasture as of April 1, and first forecast of the probable production of winter wheat. Wages being paid to hired farm labor.
May	Report for winter wheat and rye as of May 1 on acreage remaining for harvest, yield per acre, percentage abandonment of planted acreage and second forecast of probable winter wheat production. Condition of tame hay and pasture as of May 1, and stocks of hay on farms.
June	The third forecast of the probable production of winter wheat and the second forecast of the probable production of rye. Stocks of barley and rye on farms. Condition as of June 1 for spring wheat, oats, barley, tame hay, wild hay, pasture, apples, peaches, pears, and cherries. First forecast of probable production of peaches, pears, and cherries.
July	Planted acreage of each spring-sown crop, such as corn, oats, dry edible beans, potatoes, sugar beets, etc., and acreage for harvest. Yield per acre and the first forecast of probable production of each of these crops is also made. Fourth forecast of winter wheat production and third forecast of rye production. Condition of each fruit crop; first forecast of probable production of apples and grapes; and the second forecast of probable production of peaches, pears, and cherries. Condition of pasture. Stocks of corn, wheat, and oats on farms as of July 1. Stocks of wheat in country mills and elevators, July 1. Wages being paid to hired farm labor.
August	Preliminary estimate of winter wheat and rye production (no further reports until December). Estimate of cherry production. All spring crops for which the first forecast was made in June were appraised a second time as of August 1. Another forecast of probable production of apples, peaches, pears, and grapes is made. Condition of pasture.
September	The third forecast of probable production of all spring-sown field crops for which forecasts had been made in July and August are again made. Estimated production of alfalfa and sweet clover seed. Another forecast is also made of the probable production of apples, peaches, pears, and grapes. Condition of pasture.

October	Preliminary estimate of spring wheat, oats, barley, tame hay, and peaches. Another forecast of probable production of corn, grain sorghums, potatoes, beans, etc., is made together with another forecast of probable production of apples, pears, and grapes. Condition of pasture. Farm grain stocks are again reported as of October 1, together with stocks of wheat in country mills and elevators as of October 1. Wages being paid to hired farm labor.
November	Preliminary estimate of corn, sorghums, sugar beets, potatoes, beans, apples, pears, and grapes. Condition of pasture.
December	Reports issued during this month represent the final estimates of crop production during the year. These are based on all evidence compiled throughout the growing season together with information made available through extensive fall surveys made subsequent to harvest. Revisions of all previous estimates which these fall surveys indicate to be necessary. These reports include a final estimate of planted and harvested acreage for each crop together with the final estimate of production. Average prices for the season are also established and the inventory value of each crop computed. A report is also issued in December giving the estimated acreage of winter wheat and rye sown for harvest in the year following. The condition of these two crops is reported as of December 1. Estimates of barley and rye stocks are also made as of December 1.

TRUCK CROPS—Commercial Vegetables

Crops Grown for Fresh Market

Truck crop reports include estimates of acreage at planting time together with forecasts of production throughout the growing season. Most of these reports are issued from June to November during the early part of each month. These reports giving basic information are supplemented with semi-monthly truck crop news reports which give verbal descriptions of the progress and development of truck crops in Colorado together with similar information for the same crops in states which market in competition with Colorado grown crops.

Crops Grown for Processing

The program for truck crops also includes estimates of acreage and forecasts of production for crops being grown for processing. These are also issued in season.

LIVESTOCK REPORTS*

January	Cattle and sheep and lambs on feed, January 1. Condition of ranges, cattle and sheep, January 1.
February	Number and value of each class of livestock (including chickens and turkeys) on farms, January 1. Intention to purchase or home-hatch turkey poult. Condition of ranges, cattle and sheep, February 1.
March	Final estimate of wool shorn during preceding year. Condition of ranges, cattle and sheep, March 1.
April	Cattle on feed. Condition of ranges, cattle and sheep, April 1.
May	Farm production from meat animals during preceding year. Condition of ranges, cattle and sheep, May 1.
June	Spring pig crop (sows farrowed, pigs saved) and forecast of number of sows bred and to be bred to farrow fall pigs. Condition of ranges, cattle and sheep, June 1.
July	Lamb crop. Condition of ranges, cattle and sheep, July 1. Turkeys being raised.
August	Cattle on feed, August 1. Wool shorn. Condition of ranges, cattle and sheep, August 1.
September	Turkeys raised and marketing plans. Condition of ranges, cattle and sheep, September 1.
October	Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, October 1.
November	Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, November 1.
December	Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, December 1. Fall and total pig crop (sows farrowed and pigs saved) and forecast of number of sows bred and to be bred to farrow spring litters.

*Production of milk per cow and production of eggs per 100 hens is reported each month, but to avoid repetition has not been shown opposite each month in the chronology.

USERS OF AGRICULTURAL STATISTICS AND CROP AND LIVESTOCK REPORTS

(1) By Farmers:

Directly:

- (a) Guide to planning acreage changes of particular crops, and number changes of classes of livestock (basis for agricultural outlook reports).
- (b) Guide to marketing.
- (c) Supplies an official agricultural business service.
- (d) Indispensable in planning farm programs for the benefit of the agricultural industry.
- (e) Widely used by agencies which finance the agricultural industry, such as Federal Land Banks, Production Credit Associations, Private Banking Institutions.

Indirectly:

- (a) Restrains the issuance of wilfully biased or false crop reports and reduces the ill effects of misleading crop reports.
- (b) Reduces speculation. Dependable information on supply stabilizes prices and reduces the speculation margin that is necessarily taken when uncertainty of supply exists. Facilitates a better adjustment of prices in accordance with the facts of supply and demand.
- (c) Aid railroads to distribute the cars needed for moving farm products. Used as factors in rate making.
- (d) Enable economical distribution of farm equipment and supplies.
- (e) Essential for crop programs of agricultural experiment stations, intelligent marketing program of public marketing agencies, making farm loans by banks and insurance companies and the maintenance of maximum farm prices in terminal markets in accordance with supply and demand, all of which react to the farmer's advantage.
- (f) Essential for relief work such as drought relief, seed loans, and other rural relief measures.

(2) Federal Agencies such as the Farm Credit Administration, Soil Conservation, Regional Planning, Production Control, Employment Offices, etc.

- (a) Provides basic data for this work. Enables them to keep closely in touch with the needs of the agricultural industry.

(3) Cooperative Farmers' Associations:

- (a) Guide to intelligent marketing.
- (b) Basis for credit and other business transactions.
- (c) Enables them to formulate constructive programs and policies and market their products to a better advantage.

(4) Marketing Agreements:

- (a) Basis for determining need for marketing agreements. Essential for allocating distribution of grower and dealer representation on the control committees.

(5) Federal Surplus Commodities Corporation:

- (a) Essential in determining which commodities are in surplus and where and how much of them to buy.

(6) Dealers and Handlers of Agricultural Products:

- (a) Show sources of production which help buyers to find products they need.
- (b) Reflect price trends, reduce speculation which goes with uncertainty of supply and reduce the necessary handling margin and enable the payment of maximum farm prices.

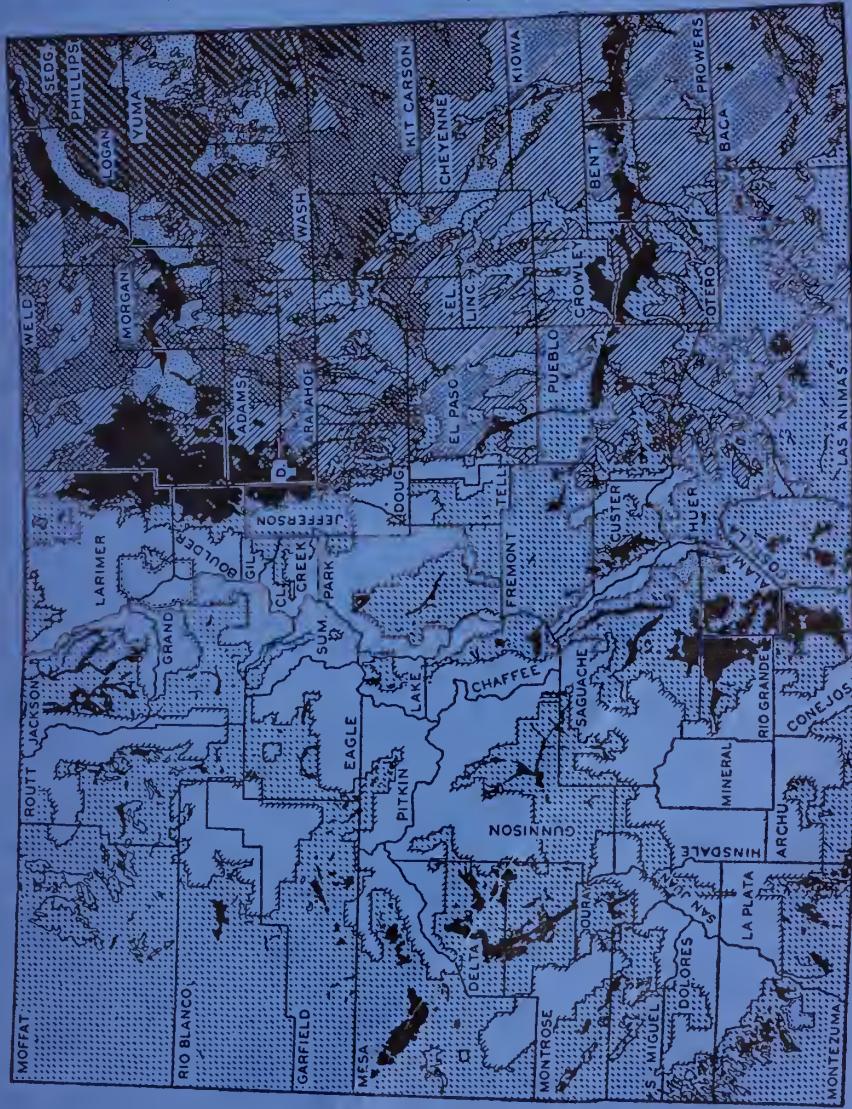

(7) Agricultural Experiment Station Extension Workers:

- (a) Best basis for preparing crop and livestock production programs. Gives a measure of the progress and changes resulting from their work.

- (8) State Marketing Organizations:
 - (a) First essential for all marketing programs.
- (9) Schools:
 - (a) Agricultural statistics are more and more being used as a basis for the teaching of agriculture in schools and colleges. Many schools in Colorado are using this material for teaching agriculture and geography.
- (10) Bankers and Financiers:
 - (a) Basis for providing credit for production, storage, and marketing of crops.
- (11) Railroads:
 - (a) Enable economical distribution of cars for moving crops and livestock.
- (12) Insurance Companies:
 - (a) Basis for crop insurance and for placing farm loans.
- (13) Manufacturers:
 - (a) Guide for determining quantities to be manufactured.
 - (b) Best basis for distribution of manufactured products used in agriculture.
 - (c) Guide to locating manufacturing plants and locating supplies of agricultural commodities.
- (14) Advertising Agencies:
 - (a) Enable the placing of advertising to the best advantage.
- (15) Meat Packers:
 - (a) Reduce the uncertainty of supply, reflect future price trend, and reduce the necessary handling margin and enable the payment of maximum price which might not be given otherwise.
- (16) Chamber of Commerce:
 - (a) Provide facts for advertising local advantages.
- (17) Prospective Investors, Settlers and Buyers of Land:
 - (a) Best guide to relative agricultural resources and advantages of states and localities.
- (18) Legislators:
 - (a) Authoritative agricultural records needed as the basis for wise and constructive farm legislation.
- (19) Economists and Business Analysts:
 - (a) Essential for analyzing agricultural and business conditions.
- (20) Business Men:
 - (a) Valuable guide for determining when to expand or contract business operations.
- (21) Farm Papers:
 - (a) Basis of editorial judgment regarding agricultural conditions and the type of information likely to be most helpful to farmers.
- (22) National and State Government:
 - (a) Basis for many activities of the Department of Agriculture.
 - (b) Indispensable in the time of war and business crises, and necessary in enacting much of the farm legislation.
- (23) General Public Welfare:
 - (a) Nearly all business is inter-dependent. That is, the prosperity and development of one business depends greatly on the prosperity and development of all other business. Crop reports furnish an indispensable link between agriculture and other lines of business, and their scope and use has been expanded immensely in the disturbed period of years since the World War.
- (24) Consumers:
 - (a) Consumers of farm products benefit by full knowledge of supplies so that they can use more of things which are most abundant.

LAND CLASSIFICATION
OF COLORADO

- Irrigated land*
- [Solid black square] First class dry farming
 - [Black square with diagonal lines] Second class dry farming
 - [Black square with horizontal lines] Third class dry farming
 - [Black square with dots] Sand hills
 - [Black square with small dots] National forests
 - [Black square with small squares] National parks
 - [Black square with diagonal lines] Grain crop land
 - [Black square with horizontal lines] Grazing land
 - [Black square with dots] Forage crop land
