FOR E W O R D

This preliminary volume of Colorado Agricultural Statistics is a continuation of our program for making the Colorado Department of Agriculture of broad-scale service to the state's agricultural industry and to the public both inside and outside the state's borders. The responsibility for developing and enlarging the program of agricultural statistics was one specifically provided for in the act creating the Department of Agriculture. This act of the 37th General Assembly transferred from jurisdiction of the State Planning Commission all statutes dealing with the gathering and dissemination of statistics relative to the state's agriculture. As a result of these statutory requirements and in response to demand from the farm organizations, business, financial and transportation agencies, and State and Federal organizations, there has been assembled in this bulletin the statistics of Colorado agriculture by counties and for the state as a whole. Nearly all phases of our important agricultural industry relating to crop acreage, production and value together with livestock numbers and production are covered. Just how important the agricultural industry is in the state's economy may be gained from the fact that approximately one-third of the state's income is derived from agricultural production, not including the value of the agricultural industry as a source of raw materials for the processing industries. The importance of the state's agricultural industry is further emphasized by the fact that the Colorado agricultural income exceeds the combined agricultural income of three bordering states—New Mexico, Utah and Wyoming.

Most of the statistical tables in this bulletin provide an historical record of state totals. The county data cover the years 1948 and 1949 for nearly all important crops. It has required many hours of painstaking care to assemble these data. The job was particularly difficult because this important phase of service to the agricultural industry and the public generally had been neglected since 1944. Fully proper procedure would have been to complete the series of county data for each of the years 1944 through 1949 before any of the data were published. However, because of the urgent demand for these data, it was felt that the most desirable procedure would be to prepare the data for these two years and subsequently fill in the back record as time and funds permit. It may in the future be necessary to revise some of these county figures for the two years given, but it is believed that the data presented herein are serviceably accurate and that they will go a long way toward meeting the present urgent needs.

This bulletin is made possible through a cooperative agreement between the Colorado Department of Agriculture and the U. S. Department of Agriculture, but the data themselves are the product of many hands. Much of the information is made available through the painstaking care and conscientious efforts of farmers and ranchers who have returned crop, livestock and price inquiries many times throughout each year to the Agricultural Statistician's office. Those who store and transport agricultural commodities have also made valuable contributions. The county assessors perform an important part in listing crop acreages and livestock data when they make their annual canvass of personal property. These data form much of the basis for the county statistics and those used in determining the state totals. All these persons and groups play an important part in making these data available for public use, but in final analysis they would never be available for public use were it not for the able and conscientious work of the clerks and secretaries who tabulate the information and make the many thousands of computations and summaries necessary to bring order out of these many individual bits of information.

If this bulletin is of use and value to you, we will appreciate having you express to us just how it is useful and we will appreciate also having your suggestions as to what should be included in subsequent volumes.

PAUL W. SWISHER, Commissioner

Colorado Department of Agriculture

OFFICE OF COUNTY
SUPERINTENDENT

REVIEW OF THE 1948 CROP SEASON

The volume of agricultural production and the level of farm income during 1948 were the largest in Colorado's agricultural history. Cash receipts from marketings were estimated at \$568 million compared with \$502 million, the previous record high attained in 1947. Significant in the 1948 crop picture were the 62.4 million bushel winter wheat crop largest of record, the 21.4 million bushel potato crop, the 2.3 million bag crop of dry beans, and the large crop of sorghum grain exceeding 3 million bushels. Significant also was the fact that the broomcorn crop of 9900 tons was one-third of the nation's total making Colorado the leading broomcorn state.

Among the disappointing phases of the 1948 season were the unusually small crop of sugar beets and the low cash returns from the large Mesa County peach crop and from some of the commercial vegetable crops. Farm profits were reduced by rising costs in general and profit margins vanished in a number of cases where packaging and marketing costs were high.

The spring season was unusually wet with the result that early spring crops were planted moderately late. This excess moisture, however, was exceptionally favorable for small grain crops later in the season and was stored in the subsoil so that it tided late maturing crops over the exceptionally dry weather which prevailed for an extended period after mid-July. This early moisture also provided a good supply of hay and grazing for range livestock. The supply of irrigation water was generally adequate. Yields per acre secured from most important crops were above average but moderately lower than the high yields obtained in 1947. The amount of hay and rough feed produced was generally adequate to winter the state's inventory of hay consuming animals and the supply of grain resulting from above average corn, barley, oats and sorghum crops fulfilled feed grain needs except in areas where grain is always imported.

The average of crops planted or grown during 1948 totalled 7.5 million acres not including a large area of summer fallowed ground. The previous record of acreage planted or grown was established in 1932 with 8.4 million acres. In that year summer fallow was the exception rather than the rule; hence, the area used for crops in 1948 established a new high.

REVIEW OF THE 1949 CROP SEASON

Continuing the high level of production which had characterized the output of the state's agricultural plant in a succession of preceding years, the year 1949 was another of high production volume. Due mostly to lower prices, however, cash receipts from farm marketings during the year amounted to only \$526 million. This was a reduction of \$42 million from the record high of 1948. Farm profits in the case of a number of commodities were further reduced by higher production and marketing costs. Winter wheat production continued at a high level with a crop of 45.5 million bushels. Although substantially lower than the record large crop of 1948, this volume maintained the state as one of the leading wheat producers. Production of spring wheat at 4.1 million bushels was the largest crop since 1938 while the corn crop of 17.3 million bushels was the largest since 1942. The oats crop of 7.5 million bushels was the largest in many years and the barley crop of 23 million bushels was by far the largest ever harvested in the state. Although potato production was reduced sharply in 1949 from the 1948 high, the crop was still the third largest ever produced. Production of dry edible beans totalled 2.5 million bags of 100 pounds for the fourth largest crop ever harvested. The crop of grain sorghums in excess of 4 million bushels was by far the largest ever produced. Yield per acre of sugar beets was the highest ever obtained, bringing total production to near average even though the acreage grown was small. Colorado again led the nation as the producer of broomcorn with about 26 percent of the U. S. total.

The planting season for spring crops was generally favorable and the yield per acre of nearly all these crops was above average and in most cases was above even the high 1948 level. Late spring and early summer moisture was plentiful, but the late summer and fall months were unusually dry. The supply of water for irrigation was abundant throughout the 1949 season. Dry, warm fall weather provided one of the most favorable harvest seasons in many years, and there was a minimum of weather damage to crops at harvest time. Due to the record

crops of barley and grain sorghums, together with the large crop of oats and fair crop of corn, the supply of feed grains was unusually plentiful and probably at a record level in volume and in relation to the number of grain consuming animals. Hay production was likewise abundant, and open fall weather permitted full conservation of hay and feed supplies for winter feeding. Fall weather conditions, although somewhat dry, were generally favorable for planting winter wheat for 1950 harvest. The acreage was reduced from the record high plantings in the fall of 1948 in response to the acreage control program. It was evident, however, that in some of the fast developing areas a good many wheat growers planted "out of compliance" for 1950.

The acreage of crops planted or grown for harvest in 1949 exceeded 8 million acres not counting the large summer fallowed acreage, thereby establishing another new high record in the extent and use of the agricultural plant.

INCREASE IN LAND USED FOR CROPS SINCE 1939

In 1939 the land used for crops amounted to approximately 7,200,000 acres. This total was made up of 6,400,000 acres of land on which crops were planted or grown for harvest in 1939 plus a rough approximation that 800,000 acres were summer fallowed. In 1949 the total land used for crops had increased to approximately 11,000,000 acres. This total consisted of 8,100,000 acres of land on which crops were planted or grown for harvest in that year plus an allowance of 2,900,000 acres of summer fallow. This represented an increase of more than 50 percent in the area cultivated annually plus the land on which perennial crops were grown. With this expansion in the agricultural plant and the increased intensity of use, it is obvious that the state's potential of agricultural production has increased greatly, and it appears that this more extensive and intensive use will continue, assuming that weather conditions continue at least moderately favorable. The greater portion of the increase in land used for crops took place in eastern Colorado especially in the counties of Cheyenne, Kiowa, Elbert, Lincoln and Washington, but the expansion was by no means confined to this part of the state. In the southwest many acres of previously untillable land were cleared of native vegetation such as sagebrush, pinion pine and native cedar, and used for agricultural purposes. A goodly portion of this expansion occurred in Montezuma and Dolores Counties, but many other smaller areas were cleared and used. Considerable new land was also broken up in parts of the northwest, and here and there parcels of land previously neglected were reclaimed and used for profitable agricultural production. Although specific information is lacking, the evidence available indicates that probably three million or more acres of virgin land were broken out and cropped during the 10 years following 1939. In addition probably one million acres of land plowed in the late 1920's and early 1930's, but which had been permitted to go back to grass, were brought into cultivation. The total increase in cultivated land in 10 years as shown by the data given previously is indicated as 3,800,000 acres.

FARM INCOME SINCE 1939

Reflecting the increased volume of production and marketings together with the substantial increase in the price level, cash income from farm and ranch marketings increased from \$125 million in 1939 to a record high of \$568 million in 1948, then declined to \$526 million in 1949. These totals were further augmented by government payments of \$10 to \$12 million per year with the exception that such payments dropped to less than \$4 million in 1949. Products produced on the farm and used there but which were of specific value amounted to a little over \$7 million in 1939. The value of these home produced and consumed commodities increased to nearly \$20 million by 1948. Included in these totals are the value of meat, seed, fence posts, etc., which are used in the farm family living or in farm production.

In appraising the farm income situation following 1939 and continuing through 1949, it is noteworthy that wheat as a cash crop accounted for a much larger percentage of the total as both production and price increased. In 1939 wheat as a cash income producer brought in only about \$7 million. By 1948 this total reached a peak of \$127 million. Cash received from the sale of cattle and calves during 1939 amounted to about \$40 million. By 1948 this total had increased to \$195 million. Other items which showed unusual gains during the 10

years from 1939 to 1948 were potatoes, dry beans and barley. Gains were made by the sugar beet, fruit, poultry, and dairy industries, but in general these parts of the agricultural economy did not share as fully in the increases as did the categories mentioned previously. In these latter groups the costs of production rose rapidly so that the increase in net profits was less pronounced. In this category also was the commercial vegetable industry where costs of growing and marketing increased greatly.

Another item of significance in appraising the change in farm cash receipts during the 10 years following 1939 is the greater importance of cash crops as income producers. In 1939 about two-thirds of the cash received from sale of farm commodities resulted from the sale of livestock and livestock products with one-third supplied by cash crops. By 1948 the crop portion had increased to 45 percent.

CHANGES IN CROP PRODUCTION SINCE 1939

Wheat—The change in the agricultural picture, principally in eastern Colorado, brought about by the rapid expansion in the acreage of this crop was almost phenomenal. The acreage planted to winter wheat increased from about one million acres to over three million acres during the decade following 1939. Adherence to summer fallow practice became the rule, not the exception, with the result that now more than five and a half million acres are devoted almost exclusively to the growing of winter wheat. In 1939 the total acreage used for this crop including summer fallow probably did not exceed two million acres. Adherence to summer fallow practice increased yields per planted acre from the 10-bushel per acre level to near the 20-bushel level. Production of winter wheat increased from about 10 million bushels in 1939 to the 40 million-bushel level in 1949, a record crop of 62 million bushels being harvested in 1948. Summer fallow practice, better and more timely tillage methods, and improved seed varieties appear to have eliminated a substantial amount of the hazard of wheat production in the eastern plains area. It isn't conclusively proven, however, the extent to which these factors were entirely responsible and how much of the contribution to improved yields and lowered percentage of abandonment of planted acreage resulted from more adequate and more timely rainfall. The acreage devoted to spring wheat declined as experience revealed this crop to be less desirable in eastern non-irrigated areas. The acreage devoted to this crop in recent years has been only about half as great as in the early 1940's.

Corn—As the acreage of winter wheat and the summer fallow practice increased, the acreage of corn grown in non-irrigated eastern areas declined sharply. In 1939 the acreage of corn exceeded one million acres. Recently the total has been between 600,000 and 700,000 acres. (In the early 1930's the Colorado corn acreage was at the two million-acre level with a record planted area of 2,580,000 acres in 1932.) The decline has been wholly in corn grown on non-irrigated land, the irrigated acreage having increased moderately with production up sharply as use of the better adapted hybrids became more general. Now nearly all corn grown in irrigated areas is grown from hybrid seed. Yields in excess of 100 bushels per acre are not uncommon. Much of the irrigated acreage in northern Colorado and in the Arkansas Valley is cut for silage. The use of hybrid seed in non-irrigated sections has increased in recent years but has not yet proved entirely successful. Even so, the average yield per acre of non-irrigated corn has increased moderately as the crop was grown on land best suited to corn.

Oats—Following the very short 1939 crop of 3,833,000 bushels, the trend of oats production was upward. A peak of 7,700,000 bushels was reached in 1945, and the volume of production continued at a fairly high level thereafter reflecting the need for this crop as a supplier of protein especially by the dairy industry.

Barley—The acreage of barley increased significantly following 1939 and this crop has become more and more important as feed grain in the agricultural economy of eastern Colorado. Part of the increase in barley resulted from shortage of manpower during the war years and increased farm mechanization. Many a Colorado hog goes to market fat, never having tasted corn, being finished entirely on barley and supplemental feeds.

Sorghums—Sorghums too came in for their share of changes as the agricultural picture shifted in eastern Colorado. The acreage of sorghum grown for all purposes increased rapidly during the 1930's and reached the million-acre level for the first time in 1940. The acreage declined thereafter and in recent years the area has dropped to around 600,000 acres. The crop has, however, gained in importance as a grain producer as improved varieties came into common use. One-third or more of the acreage is now threshed or combined for market grain or grain to be fed in local areas. Size of the crop has varied from year to year as weather conditions were a determining factor, but a record crop in excess of four million bushels was harvested in 1949.

Potatoes—Pronounced changes also took place in the potato growing industry following 1939. The acreage came more and more into the hands of experienced growers as the problems of growing the crop called for more and more specialized attention. Chief result was increasing the yield fully 100 bushels per acre during the 10-year period following 1939. This resulted from the widespread use of certified seed, more general use of commercial fertilizer, improved varieties, and increased knowledge on the part of growers. In the early part of this period average yields for the state as a whole in excess of 200 bushels per acre were the exception. Now yields over that amount and near the 300-bushel mark are expected. Growing of potatoes in Colorado is concentrated in two major areas. One is the San Luis Valley area of south central Colorado where production in Rio Grande County is dominant. The Red McClure is the principal variety grown in this area and is meeting widespread demand as its qualities are becoming better known and the efforts of the organized industry there have become effective. The other principal production area is in northern Colorado where production in Weld County is dominant. In that area, partly in response to war demands and also as a result of the price support program, an increased percentage of the crop was produced for the "early" market. The early market in Colorado means potatoes available for shipment in July and August. Most of these early potatoes are of the Cobbler variety with some Bliss Triumphs. During the years on each side of 1939 it was an exceptional year that saw Colorado potato production exceed 15 million bushels. In recent years crops have averaged well above the 15-million bushel level and crops of 18 to 20 million bushels are not uncommon. Significance of the higher yield per acre is noted here as the acreage grown is at an unusually low level.

Dry Beans—Colorado produces a large percentage of the pinto beans grown in the United States and most of the dry beans grown here are of that variety. The period following 1939 saw very rapid expansion of the pinto acreage and production in southwestern Colorado where much new land was cleared. The acreage there increased from 30,000 acres to nearly 100,000 acres. While this southwestern area was expanding, acreage in the central non-irrigated section was being reduced rather rapidly. This crop continued in favor in the northern Colorado irrigated area, and the more general use of improved seed brought about a rather significant increase in yield per acre. The bean industry in Colorado is now pretty well concentrated in the northern irrigated section and the southwestern non-irrigated area.

Sugar Beets—Sugar beets continued to play an important part in the overall agricultural economy of the irrigated areas principally the northern Colorado section, the Arkansas Valley and the lower western valleys. Shortage of manpower during the war years, high labor costs, and research in agricultural engineering brought about rapid mechanization of the sugar beet industry from planting and tending to harvesting and marketing. The acreage has varied from year to year but only in unusual years has the tonnage dropped below two million tons. Improved methods of handling sugar beet tops as a by-product have also contributed to the profitableness of growing sugar beets. Growing of this crop is closely related to the fattening of livestock for market especially in northern and northeastern Colorado and plays an important part in maintaining soil fertility and tilth.

Broomcorn—Colorado produces from 25 to 33½ percent of the nation's broomcorn. The crop is grown largely in Baca County located in the extreme southeastern corner of the state. The general level of broomcorn production after 1939 was much higher than in years preceding. In earlier years crops in excess of 5,000 tons were exceptional. Now crops in excess of 10,000 tons are the rule.

TRUCK CROPS**(Commercial Vegetables)**

Summary—For many years Colorado vegetables have been known throughout the country for their fine quality and flavor which can be obtained only in high altitudes where days are warm and nights are cool. Colorado ranks high in the national production of several of these crops and the industry is an important one in the state as related to the amount of labor employed, the gross value of the crops produced, and the high value per acre.

The rank of truck crops in relation to the acreage devoted to each of them is as follows: onions (dry), green peas, lettuce, cabbage, tomatoes, cauliflower, cucumbers, cantaloups, snap beans, carrots, spinach, and celery. Other vegetables, such as asparagus, broccoli, sweet corn, peppers, turnips, radishes, and green onions, are also grown in Colorado, but the quantity is comparatively small. Colorado leads in the production of cantaloup and cucumber seed, and production of dry onion seed has attained considerable volume in recent years.

The acreage of commercial vegetables grown for harvest in 1948 aggregated 57,180 acres with a crop value of \$12,376,000. The acreage was only slightly larger than the 55,640 acres harvested in 1939 but the value of the 1948 crops was almost double that of the 1939 \$6,308,000 evaluation. In 1949, 55,550 acres yielded crops valued at \$17,705,000. However, cost of producing, processing, and marketing rose sharply during the years so that this significant increase in gross value is no criterion of the increase in net profits to growers. In fact, considerable tonnage of several crops was not harvested in 1948 and 1949 because of low prices.

Onions—Production of dry onions made phenomenal advancement in Colorado during the period 1939 to 1948. The acreage harvested increased from 6,800 acres in 1939 to a record high of 15,500 acres in 1944. Production rose from 3,400,000 50-pound sacks in 1939 to a high of 7,290,000 sacks in 1946 and the crop increased in value from \$986,000 in 1939 to an all-time high of \$10,164,000 in 1947. During the 9-year period of 1941-1949, inclusive, Colorado led all states in the nation in the production of dry onions in three of these years and placed second in the remaining six years, and accounted for more than 15 percent of the country's late onion output. In several of these years, however, considerable quantities of onions were not harvested because of glutted national markets and low prices. Remunerative value of the crop to growers has been very irregular, and in some years they have been compelled to sell their onions at prices that were below the cost of production. As transportation and other marketing costs rose, the long haul to consumer markets placed Colorado growers at a decided disadvantage in competing with onion producing states in the east and middle west. In 1948 the 5,500,000-sack crop was evaluated at \$4,160,000 and the 1949 production of 5,650,000 sacks was worth \$7,628,000.

Green Peas—The fresh market pea industry fluctuated widely in volume during the past decade. The acreage harvested increased steadily from 9,300 acres in 1939 to a record high of 14,500 acres in 1942 and 1943, but dropped sharply after the war years to a low of 6,400 acres in 1948 and 5,500 acres in 1949—the smallest acreage harvested since 1928. For many years, Colorado has furnished about two-thirds of the nation's summer green pea supplies but the quick-freeze industry has made sharper inroads into the fresh pea market than that of any other vegetable grown in the state. The green pea shipping deal has always been at a disadvantage as approximately two-thirds of a pound of peas consists of pods. This disadvantage became even more pertinent as transportation and other marketing costs rose. It's a long haul to eastern markets. Production of peas for fresh market amounted to 640,000 bushels in 1948 and 578,000 bushels in 1949, compared with 1,023,000 bushels in 1939. These crops were evaluated at \$1,120,000, \$780,000, and \$767,000 respectively. Production of green peas grown for manufacture has shown less change. Production of 2,920 tons (shelled) in 1948 was worth \$225,000 to growers compared with 2,630 tons valued at \$97,000 in 1939. In 1949 a total of 4,040 tons were produced with a cash value of \$298,000.

Lettuce—The harvested acreage varied only from 4,200 acres in 1939 to 4,600 acres in 1947 but jumped sharply to 7,000 acres brought to maturity in 1948 and 6,500 acres in 1949. However, approximately one-half of the 770,000 crates produced in 1948 and one-fourth of the 780,000 crates raised in 1949 were not harvested because of a national over-supply and low prices. The lettuce actually

marketed was valued at \$840,000 in 1948 and \$1,530,000 in 1949, compared with \$399,000 in 1939. However, net profit to growers failed to keep pace with the increase in crop value due to the sharp rise in costs of production and marketing.

Cabbage—The acreage planted to cabbage did not change greatly during the period 1939-1948 but production showed a definite uptrend by virtue of increased yields per acre. In 1948 a crop of 64,000 tons was valued at \$774,000 compared with 48,500 tons worth \$644,000 in 1939. The 1949 crop of 80,700 tons was evaluated at \$1,668,000.

Tomatoes—Tomatoes were grown in 1948 on 5,100 acres of which 2,000 acres were harvested for fresh market and 3,100 for canning. The total crop was valued at \$1,160,000 in 1948 and \$1,080,000 in 1949, compared with \$476,000 in 1939.

Cauliflower—Colorado is the only state west of New York growing cauliflower in commercial quantities during the summer, and produces about 40 percent of the nation's summer supplies. The acreage has varied only moderately in the last decade. The state produced 880,000 crates in 1948 and 840,000 crates in 1949, compared with 864,000 crates in 1939. Cash value jumped from \$259,000 in 1939 to \$703,000 in 1948. The rise in value, however, has hardly kept pace with the increase in production and marketing costs. In fact, some flower was not harvested in 1948 because prices were too low to justify a clean harvest.

Cantaloup—The cantaloup industry passed through fluctuating changes during the last decade. The harvested acreage declined from 5,500 acres in 1939 to 1,900 acres in 1943—the lowest in 23 years of record—then rose to 4,100 acres in 1948, and since then it has taken another downward plunge. The largest acreage of record was in 1929 when 9,460 acres produced a crop worth more than one million dollars. The 1948 crop of 410,000 crates valued at \$406,000 compared with 550,000 crates worth \$412,000 in 1939. Production of 332,000 crates in 1949 was valued at \$378,000. It is obvious that prices received by growers have fallen far short of keeping pace with the sharply rising costs of production and marketing which accounts for 29 percent of the 1948 crop and 19 percent of the 1949 crop being left unharvested. These economic conditions combined with repeated severe hail and disease losses have discouraged cantaloup production in Colorado. Honeydew melons have faced the same discouraging factors with the result that the acreage dropped from 4,500 acres in 1939 to 100 acres in 1948 and for which estimates are no longer carried on the estimating calendar for Colorado.

SUPERINTENDENT

WHY CROP AND LIVESTOCK REPORTS¹

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agricultural and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.

¹The above summary was prepared by A. E. Anderson, in charge of the Crop Reporting work for the Nebraska Department of Agriculture and the U. S. Department of Agriculture in Lincoln, and appeared in *Nebraska Agricultural Statistics—1948*. It is used here because it presents clearly and concisely the basic reasons for having factual information regarding the agricultural industry.

¹ These figures included in all cattle and calves.

CHANGES IN LIVESTOCK NUMBERS SINCE 1939

Cattle and Calves—The Colorado cattle industry underwent some significant changes following 1939. During this period the inventory and consequent production was placed on a substantially higher level. At the beginning of 1939 the number of cattle and calves on farms and ranches in the state totalled only 1,400,000 head. This number increased significantly thereafter until a peak of 1,920,000 head was reached at the beginning of 1944. The number was then reduced moderately until the 1,800,000 level was reached at the beginning of 1949. A large percentage of the animals making up this inventory was cows and heifers of breeding age, thus revealing the high potential for maintenance and further expansion if feed conditions warrant. Of this number nearly 800,000 head were cows and heifers two years old and over with an additional 250,000 one to two year old heifers being held.

Along with the change in total number of cattle and calves during this period some significant changes in the location of the animals also occurred throughout the state. Partly as a result of grazing restrictions on public lands, numbers declined significantly in the northwest and mountain section of Colorado. The total increased slightly in the west central and southwestern areas and remained about steady in the south central portion comprising the San Luis Valley. As grazing conditions improved in eastern Colorado there was a substantial increase in inventory numbers in the east central and southeastern areas. In northern Colorado the inventory increased significantly both in breeding herds and as a result of the increased number of animals held in feed lots at the beginning of the year and being grain finished for market.

The cattle industry has long been the principal cash income producer as the animals were sold from range and feed lot and the relative position of this industry as an income producer increased rapidly after 1939. During that year the gross cash receipts from sales of cattle and calves amounted to about \$40 million. By the end of 1948, just 10 years later, these gross cash returns had increased to \$195 million, an all-time high and five times the 1939 total. Included in these totals are the returns from sales of dairy animals as well as beef animals. The record receipts in 1948 were also significant in that they amounted to almost one-third of the total cash receipts from all farm and ranch marketings of both crops and livestock during that year. The year 1948 was outstanding in another particular in that this large increase in the cash receipts was attained without decreasing inventory numbers. Cash receipts from marketings of cattle and calves amounted to \$180 million in 1949.

Stock Sheep and Lambs—The range sheep industry experienced some of its most difficult years during the period following 1939. Precisely illustrative of these difficulties is the fact that inventory numbers after reaching an all-time peak of 1,889,000 head as of January 1, 1942, declined to 1,210,000 head by January 1, 1949, a drop of 36 percent. Principal reasons for this extreme decline

in one of the basic portions of the state's agricultural industry were the hazards resulting from loss of experienced herdsmen to the armed forces and to war industries, high costs of labor and materials as related to the income from sheep, lambs and wool, reduction in grazing permits on public lands, and the greater profitableness of the range cattle business. There is little indication that the range sheep business in Colorado or for that part the major range sheep areas of the west will ever again attain its 1942 level. It is significant that stock sheep numbers in Colorado are the lowest since 1926 and for the nation the lowest for which records are available which cover three quarters of a century. As the Colorado range sheep inventory declined, lamb crops and wool production diminished almost proportionately. However, there was a moderate up-trend in the average weight per fleece as the quality of animals was improved, and the percentage lamb crop also increased moderately. During the period of 1939 and the early 1940's, lamb crops in excess of 1,300,000 head were the rule. In recent years this number has declined below one million head annually. The amount of wool shorn decreased from the usual 13 to 14 million pound level to around 9½ to 10 million pounds.

It is noteworthy, however, that rising prices for both sheep and wool have resulted in gross cash receipts even larger in the last few years than during 1942 when sheep numbers were at their peak. Cash receipts from marketings of sheep amounted to over \$33 million in 1948 setting a new high record. The 1949 income was \$26.6 million while in 1942 this cash take was only a little over \$26 million. Wool made a less favorable income showing, the total in 1948 being about \$4.6 million compared with \$5.8 million in 1942 and the record take of \$6 million for the 1943 clip. Income in 1949 was \$4.5 million.

The decline in stock sheep numbers in the different areas of the state varied considerably following 1939. In the northwest and mountain area the decline amounted to about one-third from the peak reached in 1942. In the west central and southwestern areas the decline was only about one-fourth from the 1942 peak. In the entire plains section east of the mountains the decline in stock sheep numbers after 1942 was very sharp and by 1949 the number of sheep left in this large area comprising nearly one-half of the state's surface was only about one-third as large as in 1942, the decline amounting to nearly two-thirds. In the south central area comprising that section of Colorado commonly referred to as the San Luis Valley, yet embracing some adjacent mountainous and range areas, sheep numbers were fairly well maintained. In appraising the sheep situation in this area, however, it should be noted that the number of range sheep declined significantly but that the number of sheep maintained in farm flocks was increased substantially. This resulted from larger flocks as well as from more farmers keeping a small bunch of sheep. These animals were maintained largely on sweetclover pasture during the summer months and on crop residue and alfalfa hay during the winter feeding period. Use of sweetclover pasture and alfalfa hay is a profitable combination which worked well in rotation with commercial potatoes. Sheep numbers in the Valley at the end of 1949 were only about 15 percent lower than at the 1942 peak.

Sheep and Lambs on Feed—At the beginning of 1939, 1,105,000 lambs were in the feed lots of northern Colorado, the Arkansas Valley and other minor feeding areas. This industry centers in northern Colorado, principally in Weld, Larimer and Morgan counties. The volume of lamb feeding has been on a downtrend since 1930 and this downturn continued after 1939 until on January 1, 1949, the number in feed lots totalled only 520,000 head, a new low record since the industry became well established. Part of this sharp decline in lamb feeding resulted from the general decline in stock sheep numbers, but the decline also resulted from shifting over to cattle feeding. The quality of Colorado feed-lot fattened lambs is well known in eastern markets, the principal points of consumption, as well as in mid-west and local markets.

Cattle on Feed—As lamb feeding decreased, cattle feeding was expanded in almost like proportion when the difference in feed requirements is taken into account. At the beginning of 1939 only 125,000 cattle and calves were in feed lots being fattened for market. This number increased gradually thereafter and on January 1, 1949, the number totalled 192,000 head. Most of these animals are finished in northern Colorado feed lots, principally in Weld, Morgan, Logan and Larimer counties, but the amount of grain finishing of cattle and calves has increased also in the non-irrigated sections of eastern Colorado and in the Arkansas Valley.

Hogs—Hog numbers began to expand in 1939 from an inventory of about 278,000 head. This expansion continued through 1943 and on January 1, 1944, a record total of 774,000 hogs and pigs was in the inventory. This sharp increase was in response to war demands. The number of hogs raised declined sharply in 1944 and this decline continued through 1946, and in subsequent years has remained near the 300,000 inventory level. At the peak of hog production in 1943, the number of pigs saved from combined spring and fall litters totalled 961,000 head. In recent years pig crops have averaged about 400,000 head. With the rapid growth of population on the Pacific Coast there has been an increased demand for Colorado grown hogs and prices on the Denver market make hog raising an advantageous enterprise to those well established in the business.

Chickens Raised—During the 1930's the number of chicks raised on farms annually varied from 5 to 6 million birds. This number was increased to a record high exceeding 9 million birds during 1943 as a result of war needs for all kinds of meat. The number continued large in 1944 and also into 1945, but after war needs subsided, the farm chicken industry declined to near its pre-war level.

Conclusion of the war gave rise to a new phase of the chicken industry in Colorado. Population growth in Denver and other principal cities provided market for a large number of broilers and broiler production soon exceeded one million birds annually. These broilers are not included in the farm raised chickens discussed in the preceding paragraph.

The farm chicken inventory at the beginning of the year consists mostly of hens and pullets being kept for layers. These are the working birds which provide the supply of eggs throughout the year and total from 3½ to 4 million birds at the beginning of each year.

Egg production has totalled about 400 million eggs annually in recent years. Only during 1944 did the number exceed one-half billion eggs.

Turkeys—Colorado turkey growers provide some of the finest birds in the nation. This industry reached its peak in 1939 when more than one million birds were raised. In the seven years following, this number averaged about 900,000 birds per year, but in recent years the number has declined to approximately 600,000 birds annually.

¹ Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

² Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

³ Value of combined sales plus value of products consumed in the farm household.
