REVIEW OF THE 1951 CROP SEASON

The total volume of principal field and fruit crops produced in Colorado during 1951 was below average and somewhat less than in 1950. Principal field and fruit crops showing less than average output in 1951 were: winter wheat, corn, spring wheat, oats, barley, rye, potatoes, dry beans, field peas, all hay, broomcorn, apples, peaches, and cherries. Only sugar beets, sorghums and pears showed above average output for 1951.

Several important weather factors accounted for the below average crop production. The more important ones were freeze damage and cool weather during the winter and early spring that reduced fruit production and retarded planting and growth of field crops. The spring season was generally slow to develop following a very open and dry winter and resulted in the largest acreage abandonment of winter wheat ever recorded in Colorado, 1,173,000 acres.

Once again, a severe moisture shortage throughout the growing season in the southern half of the state materially reduced crop yields. The supply of diverted irrigation water was extremely short in the San Luis Valley and was only fair in the Arkansas Valley and the Southwest. Producers in the San Luis Valley during 1951 faced one of the most critical situations in the recent history of that area. Many farmers found it necessary to irrigate their land in order to have sufficient moisture for planting. Continued irrigation throughout the season became extremely difficult since stream flow was low and reservoir stocks deficient. Pumped water was largely responsible for bringing the potato crop to maturity. Water for irrigation was mostly adequate in the northern half of the state. Heavy rains in eastern Colorado during planting time made it necessary for farmers in that area to alter their earlier plans considerably. This resulted in reduced plantings of spring small grains and an increase in plantings of later crops, notably sorghums, corn, and beans. The rains of late May and early June resulted in unusually large plantings of sorghums to take advantage of the favorable moisture situation. Much acreage was abandoned, however, since replanting was necessary on an unprecedented scale with large areas finally given up as being too late for planting an additional time. This resulted in an unusually large acreage of sorghums being abandoned.

Production of the four principal feed grains in 1951 totalled 26,826,000 bushels, 11 percent above the comparable 1950 total of 24,116,000 bushels but 27 percent below the average of the preceding 10 years. A total wheat crop of 34,870,000 bushels in 1951 was about 2 million bushels under the 1950 crop of 36,909,000 bushels. Production of potatoes during 1951 recorded the lowest mark in 12 years with only 12,240,000 bushels, 33 percent less than the 18,200,000 bushels produced in 1950. Hay production was again short in 1951, well below average, and inadequate in relation to livestock numbers. Peach production was the shortest on record at 316,000 bushels. The Mesa County crop was very short and the Delta County crop a complete failure. Delta County apple production was good but prices were low.

Lower production of crops in 1951 compared with 1950 was largely offset by higher unit prices for most products. Cash received from the sale of livestock and livestock products during 1951 was the highest of record at \$382,487,000. Cash income from crops alone totalled \$170 million. This was \$14 million under the estimated 1950 income from sale of crops. Combined cash receipts from farm marketings of crops and livestock in 1951 exceeded the 1950 total by about \$49 million. The estimated total cash receipts for 1951 was \$553 million compared with \$503 million in 1950 and marked the second highest total on record. It is important to note here, however, that farm expenses reached a record high in 1951.

Potatoes—A substantial reduction in the acreage planted to potatoes in the spring of 1951 coupled with an unusually large abandonment and low yields, resulted in the smallest potato crop since 1939. The 1951 crop of 12,240,000 bushels was 33 percent under the 1950 crop of 18,200,000 bushels and considerably below the average of the preceding 10 years. Acreage harvested in 1951 totalled 48,000 against 56,000 in the preceding year and marked the smallest harvested acreage on record.

The serious water shortage which developed early in the season and lasted throughout the year in the San Luis Valley resulted in greatly reduced acreage in this important area. Quality of the late crop in the area, however, was very good despite the difficulties of production. Northern Colorado had a very short crop of potatoes in 1951, especially the late crop which was plagued by exceptional damage from late blight. Acreage of early potatoes was reported to be somewhat larger than in 1950 but early potatoes account for only a small fraction of the total production. Some actual acreage loss was experienced in the San Luis Valley and parts of some fields didn't make a stand due to water shortage. In northern Colorado the loss was primarily due to blight with some loss from hail.

The average price received for the 1951 crop was much higher than that for the 1950 crop. This resulted in the 1951 crop having the higher value even though production was smaller. Inventory value of the 1951 crop totalled \$22,154,000, 17 percent greater than the value of the 1950 crop which totalled \$18,928,000.

Dry Beans—Production of dry beans in 1951 totalled only 1,563,000—100-pound bags, the smallest crop since 1937 and 14 percent under 1950. Acreage planted to beans continued the downward trend of recent years and reached the lowest point since 1923 at 230,000 acres. Dry weather throughout the season, particularly in the southwestern non-irrigated area, resulted in unusually large abandonment of acreage. For the state as a whole only 203,000 acres were harvested with an average yield of 770 pounds, uncleaned. Average yields were estimated at 1,400 pounds per acre on irrigated land but only 205 pounds per acre on non-irrigated land. This was much below 1950 and average, and resulted in production of 1951 beans being concentrated largely in the northern irrigated section of the state. The 1951 crop was inventoried at \$9,842,000, 13 percent under the value of the 1950 crop and marking the lowest point in five years.

Sugar Beets—Production of the 1951 crop of sugar beets totalled 1,906,000 tons, 13 percent less than the 1950 crop of 2,183,000 tons but somewhat more than the 10-year average (1940-49) of 1,883,000 tons. Acreage harvested in 1951 totalled 124,000 against 146,000 acres harvested in 1950. The average yield of 15.4 tons per acre attained for the 1951 crop has been exceeded only once in the previous history of the sugar beet industry in Colorado.

Early in the season, growers' concern over an inadequate labor supply resulted in a reduction of acreage planted, both from the preceding year and early spring intentions. Acreage planted in 1951 totalled 132,000 acres as compared with 154,000 acres in 1950. Some acreage was abandoned later in the season from inability to obtain help for thinning. Frost, poor stands, and hail were also responsible for some acreage loss. An unusual amount of late rain and snow in northern Colorado during October delayed harvest, but by early December harvest was complete with yields and sugar content high.

The lower tonnage production coupled with a lower price per ton brought the total value of the 1951 crop to \$22,681,000, 13 percent under the value of the 1950 crop.

Corn—The total 1951 corn crop amounted to 14,482,000 bushels, somewhat above the 13,368,000 bushels produced in 1950 but very near the 1940-49 average. Acreage totalled 591,000 planted with 557,000 harvested. The average yield of 26.0 bushels was higher than the preceding year and average. A larger proportion of corn than usual was grown on irrigated land with an average yield of 50 bushels. Non-irrigated corn returned an average of 13.5 bushels per acre. Value of the 1951 crop was the highest of record at \$26,647,000, and 25 percent above the value of the 1950 crop.

Considerable late planting coupled with some late season hail and frost damage, especially in northern Colorado, resulted in an unusually large portion of the 1951 crop being diverted to use as silage rather than grain.

Oats—Acreage planted to oats in 1951 was reduced only slightly from 1950 but the highest rate of abandonment experienced in recent years dropped the acreage harvested to the lowest point since 1942. Oats were harvested from 182,000 acres in 1951 and production totalled 5,187,000 bushels with an average yield of 28.5 bushels. The 1951 oat crop was inventoried at \$5,135,000, 14 percent above 1950 and 26 percent above average.

Average yield obtained on irrigated land in 1951 was estimated at 36 bushels, practically the same as in 1950, while yield on non-irrigated land was 21 bushels in 1951, five bushels more than the average of the preceding year.

Oat acreage cut for hay in 1951, both due to general weather influences and the need to make maximum use of available feed in short feed areas, was unusually large.

Barley—The record winter wheat plantings in the fall of 1950, together with only limited planting of spring barley on abandoned winter wheat ground, resulted in a substantial reduction in acreage planted to barley for the 1951 crop. In 1951, seedings of both winter and spring barley totalled only 518,000 acres. This was a reduction of 37 percent from the 1950 plantings of 822,000 acres. Abandonment, however, was not as great in 1951 and harvested acreage declined only 17 percent from the preceding year. Average yield increased from 19.5 bushels in 1950 to 23.5 bushels in 1951. Both production and value of the 1951 crop exceeded the 1950 estimates. A total crop of 9,541,000 bushels valued at \$12,308,000 was taken from the 406,000 acres harvested in 1951. This compares with a crop of 9,536,000 bushels valued at \$10,871,000 taken from the 489,000 acres harvested in 1950.

Sorghums—In 1951, the largest acreage planted to sorghums in a decade was accomplished. An estimated 819,000 acres were planted for all purposes. Of this acreage, 229,000 acres were harvested for grain, nearly $2\frac{1}{4}$ times as much as the low acreage harvested in 1950. An average yield of 12.0 bushels, the same as the year before, produced 2,748,000 bushels of sorghums for grain. A total of 475,000 acres were harvested for either silage or forage. Acreages harvested for both purposes were well above 1950.

In the southeastern quarter of the state, particularly in Kit Carson, Cheyenne, Kiowa, Prowers, and Baca Counties, farmers, in an effort to turn a cash crop quickly, took advantage of early spring moisture to plant sorghums as a catch crop on the large acreage made available by the abandonment of winter wheat. Drenching rains succeeded in washing out plantings in the area once, sometimes twice, and occasionally three times. Some fields were washed out successively until farmers felt it too late to attempt another planting and held the ground over for winter wheat. The remainder or the season proved favorable for the acreage which finally made a stand.

Value of 1951 sorghums utilized for grain was placed at \$3,792,000, those utilized for forage \$8,820,000.

Hay Crops—The acreage of hay cut in 1951 was the smallest of record. Only 1,291,000 acres were harvested with an average yield of 1.57 tons. A total production of 2,026,000 tons, however, exceeded the short 1950 crop of 1,977,000 tons and was near average. The short feed crop in 1950, the serious drought situation in southern Colorado in 1951, and increasing livestock numbers, however, pushed prices to record high levels and the 1951 total hay crop was valued at \$66,048,000, the highest in history.

The large reduction in acreage of hay cut was primarily the result of the much below average production of wild hay. In the San Luis Valley, where large acreages are ordinarily cut, the character of the season made it necessary to graze livestock on meadows and other land which would have customarily

been saved for hay. The 1951 crop of 345,000 tons of wild hay was 10 percent below the 1950 production and below average. The average yield of .85 tons per acre is one of the lowest on record. The area of wild hay cut in 1951 totalled 406,000 acres, compared with 427,000 acres in 1950 and 441,000 the 1940-49 average.

Primarily due to the favorable fall conditions in the northern Colorado irrigated district, both yield and production of alfalfa hay increased over the 1950 estimates. The total 1951 crop of 1,342,000 tons was harvested from 610,000 acres. This compared with 604,000 acres cut in 1950 with a total production of 1,268,000 tons. Production of all other tame hay in 1951 totalled 329,000 tons, nearly the same as a year before. However, this production was cut from a smaller acreage, 275,000 acres in 1951 as compared with 285,000 in 1950. Weather during the harvest season was generally favorable and quality of the 1951 tame hay crop good.

Broomcorn—Washing rains in the southeastern Colorado broomcorn area resulted in extensive and successive replanting of fields. Although acreage planted to broomcorn was reduced in 1951 from 1950, moderate abandonment resulted in very nearly the same acreage being harvested. A total production of 8,300 tons was taken from the 74,000 acres harvested. The outstanding feature of the 1951 broomcorn season was the record high average price of \$425 per ton. Total value of the crop was estimated at \$3,528,000, the highest since 1946.

It was generally reported that an unusually large amount of broomcorn was sold early in the season while much of it was still in the rick with final settlement to be made after seeding and baling had been completed. Most prices ranged from \$390 to \$450 per ton with an extreme top of \$500. Quality was generally good with brush mostly superior to the poor quality and light weight brush harvested in 1950.

Colorado maintained its position as a broomcorn producer with 25 percent of the U. S. production, and was second only to Oklahoma.

Alfalfa Seed—Production totalled 2,000,000 pounds (clean) in 1951, 13 percent under the 1950 total of 2,300,000 pounds. Acreage harvested was 23,000 in 1951 as compared with 27,000 in 1950. A record high price of \$50.00 per 100 pounds was placed on the crop resulting in a total value of \$1,000,000.

Sweetclover Seed—Drought conditions throughout the major producing areas resulted in the shortest crop of sweetclover seed harvested in recent years. A total cleaned production of only 1,400,000 pounds, less than half that of the preceding year, was produced in 1951. Total value of the crop was placed at \$146,000, the lowest figure since 1943. Production of cleaned **Sudan Grass Seed** in 1951 totalled 5,200,000 pounds, nearly 8 times the extremely short crop of 1950. The 1951 crop was inventoried at \$359,000.

FRUIT CROPS

Apples—The total production of 1,292,000 bushels in 1951 was much larger than the record low crop of 1950 which amounted to only 882,000 bushels. Due to very low prices at harvest time, total value of the 1951 crop was lower than that for 1950. A value of \$1,843,000 was placed on the 1951 crop while a value of \$2,030,000 was estimated for the previous year's crop.

For the most part, apples on the Western Slope, especially in Delta County, were of very good quality. Container, labor, and shipping costs, however, prohibited harvest of any but the best apples. Consequently, only about 80 percent of the apples actually produced were harvested. This made 1951 the fourth successive year in which a good apple crop was produced but a goodly portion not harvested because of a slow market and low prices.

Peaches—The 1951 peach crop was the smallest of record at 316,000 bushels. Severe winter and early spring freezes obliterated the crop in Delta County and reduced production in the Palisade-Grand Junction area to a small fraction of a normal crop. Some production was obtained from Montezuma County in the extreme southwestern corner of the state.

Lower than average production in other late producing peach states which market in competition with Colorado helped to bring the price up to \$3.85 per bushel, a price exceeded only once in previous history of the peach industry in Colorado. The total 1951 crop was valued at \$1,217,000. This, however, was still considerably less than half the \$3,291,000 value of the previous year's crop.

Cherries—The sour cherry crop totalled 3,200 tons in 1951, just double that of the very low 1950 crop of 1,600 tons. While price received per ton declined \$10.00 from the year before to average \$130.00, total value of the 1951 crop was \$390,000, more than 1¾ times the value of the 1950 crop.

Prospects improved throughout the season and sour cherry production exceeded all early indications. Although trees did not show heavy leaves, they developed a surprisingly large crop of cherries. The crop was about two weeks late with most of it harvested after August 1.

Sweet cherry production in 1951 totalled 380 tons. This compared with 230 tons in 1950. The average price per ton for the 1951 crop was \$390.00 and the total value was placed at \$148,000, an increase of 66 percent from 1950.

COMMERCIAL VEGETABLES

Commercial vegetable production is an important industry in Colorado as related to the amount of labor employed, the gross value of the crops produced and the high returns per acre. The acreage planted to some crops grown for fresh market has declined significantly in recent years but the state still ranks high in the national production of vegetables for fresh consumption. Considerable tonnage is also grown for processing in local canneries.

The commercial vegetable areas comprise four principal sections in widely separated sections of the state. These might be described as the Denver and Northern Colorado section, the Arkansas Valley district extending from Fremont County eastward to Prowers County, the San Luis Valley, and the lower Western Valleys located primarily in Montrose, Delta and Mesa Counties. The rank of vegetables grown in 1951 in relation to the acreage devoted to each is as follows: onions, green peas, lettuce, tomatoes, cabbage, sweet corn, cucumbers, cauliflower, snap beans, cantaloups, carrots and spinach. The principal crops in the above group which are utilized for processing are green peas, tomatoes, cucumbers for pickles and snap beans. Several other vegetables are also grown for local markets but the quantity is small.

A total of 46,000 acres of commercial vegetables were grown for harvest in 1951 which yielded an aggregate production of 267,000 tons valued at \$13,798,000. In 1950 about 52,000 acres produced 329,000 tons of vegetables worth \$8,863,000. It is estimated that 76,000 tons of the 1950 output were left unharvested because of an over-supplied national market which resulted in a lack of demand and prices so low they failed to cover the cost of harvesting and marketing.

Onions—Dry onions continue to hold top spot in the state's vegetable industry. In 1951 Colorado ranked fifth among the states in the late storage onion group with a production of 3,080,000 sacks which amounted to 10 percent of the nation's total fall and winter onion supplies. The state held third place in 1950 with a crop of 4,510,000 sacks. The sharp drop in the 1951 outturn was the result of reduced plantings, unusually heavy acreage loss from hail damage and the lowest yield per acre obtained since 1936. The principal producing Arkansas Valley experienced the poorest season in many years with heavy loss of acreage and low yields on much of the acreage actually harvested. The 1951 crop was worth \$4,312,000 compared with the \$2,520,000 valuation of the 1950 crop. The 1950 season was characterized by an economic abandonment of 910,000 sacks left unharvested for lack of demand and very low prices received for the portion of the crop that was harvested. In 1951, 8,800 acres were harvested compared

with 11,000 acres brought to maturity in 1950 of which only about 8,800 acres were actually harvested.

Green Peas—The steady decline in acres devoted to fresh market peas continued through 1951 when only 2,500 acres were harvested against 3,700 acres in 1950. Production in 1951 totalled 138,000 bushels valued at \$304,000 compared with 296,000 bushels worth \$533,000 in 1950. In contrast to the fresh market deal, production of green peas utilized for processing has shown less change through the years. The 1951 crop of 4,340 tons (shelled) was worth \$328,000 to growers while in 1950, 3,700 tons were produced with a cash value of \$257,000.

Lettuce—In 1951, production on 5,000 acres amounted to 575,000 crates valued at \$1,000,000. In 1950 a total of 6,000 acres yielded an aggregate of 780,000 crates but less than half of this lettuce was harvested because of glutted national markets and the harvested crop carried a cash value of only \$422,000.

Tomatoes—About three-fourths of the total acreage is grown for processing either as juice or fruit. Production of tomatoes for canning in 1951 totalled 24,500 tons against 20,100 tons in 1950, while the output for fresh market in 1951 amounted to 338,000 bushels compared with 405,000 bushels a year earlier.

Cabbage—Domestic type cabbage supplies the summer market and a small amount is utilized for the manufacture of kraut, while fall and early winter markets are supplied mainly with Danish types together with some late domestic cabbage. The over-all acreage has not changed greatly from year to year in recent years. The 1951 crop totalled 55,200 tons bearing a cash value of \$1,690,000. In 1950 production aggregated 65,200 tons with a value to farmers of only \$379,000. Almost half of the 1950 tonnage was left unharvested for lack of markets and the cabbage harvested brought the lowest prices of any year since 1940.

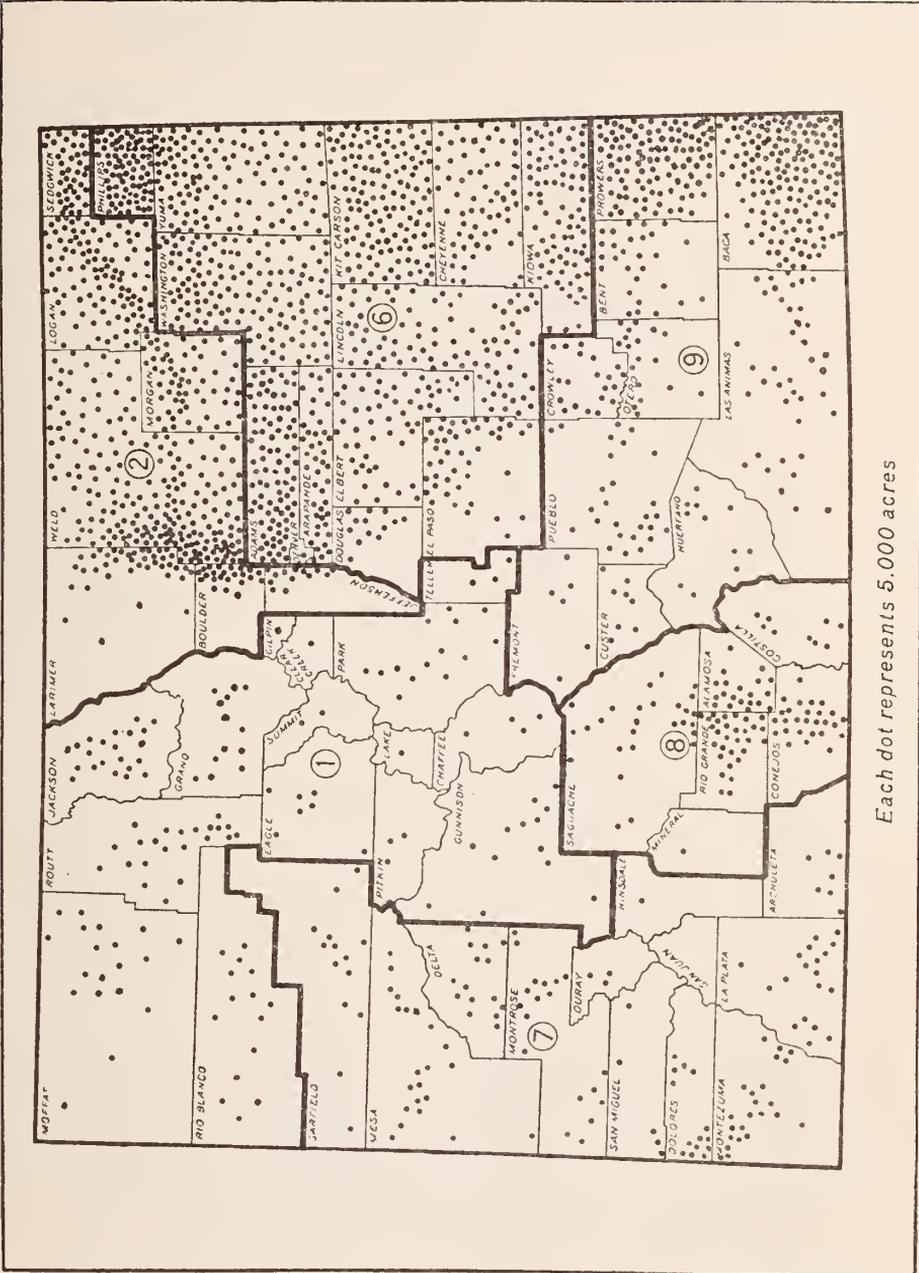

Cauliflower—Colorado produced more than 40 percent of the nation's summer cauliflower. The bulk of the state's acreage is grown in the San Luis Valley. Production in 1951 was estimated at 578,000 crates valued at \$751,000. The 1950 crop totalled 742,000 crates of which only 642,000 crates were harvested at a value of \$482,000. The national market was over-supplied in 1950 and prices received by growers were the lowest in six years.

Cantaloups—The consistent decline in acreage planted in the past several years continued through 1951. Smaller plantings together with severe hail losses reduced the area harvested in 1951 to 1,500 acres compared with 2,400 acres brought to harvest a year earlier. The 1951 crop of 150,000 crates was valued at \$308,000 while in 1950, 240,000 crates were brought to maturity with the market taking only 180,000 crates at a total value of \$261,000.

Snap Beans—Production for processing in 1951 amounted to 3,900 tons valued at \$296,000 while the fresh market crop was estimated at 112,000 bushels bearing a cash value of \$269,000. In 1950, the canning crop of 5,100 tons brought \$432,000 to growers and the fresh market crop of 160,000 bushels was worth \$256,000.

Carrots—Total production of carrots in 1951 equalled 375,000 bushels, 7 percent greater than the 1950 production of 350,000 bushels. Acreage also increased by 7 percent in 1951 to total 1,500 acres as compared with 1,400 acres a year earlier. Price per bushel at \$1.80 in 1951 was considerably higher than the year before and average. The 1951 crop was valued at \$675,000. This was an increase of 83 percent from the value of \$368,000 placed on the 1950 crop. The acreage of carrots reached a peak of 2,600 acres harvested in 1943. This was more than four times the acreage of ten years earlier and double the acreage harvested in 1942. In recent years the area has approximated 1,500 acres annually.

TOTAL CROP LAND (1950 FEDERAL CENSUS — ACRES HARVESTED, FAILURE, IDLE AND FALLOW IN 1949)

Each dot represents 5,000 acres

COLORADO LAND AREA, OWNERSHIP AND OPERATION

Colorado land area ¹	66,510,080 acres

¹ These data are taken from the August 1952 issue—Survey of Current Business published by the U. S. Dept. of Commerce, under the heading "Total Income Payments to Individuals." Included is a long list of agencies public and private which pay cash to individuals and investors. For complete detail see "Technical Notes" in August 1950 issue of Survey of Current Business.

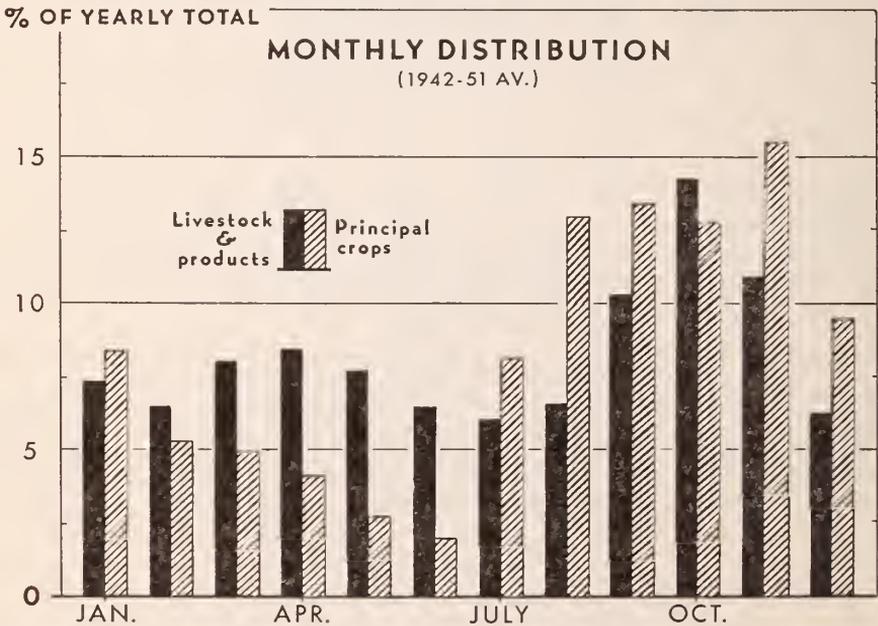

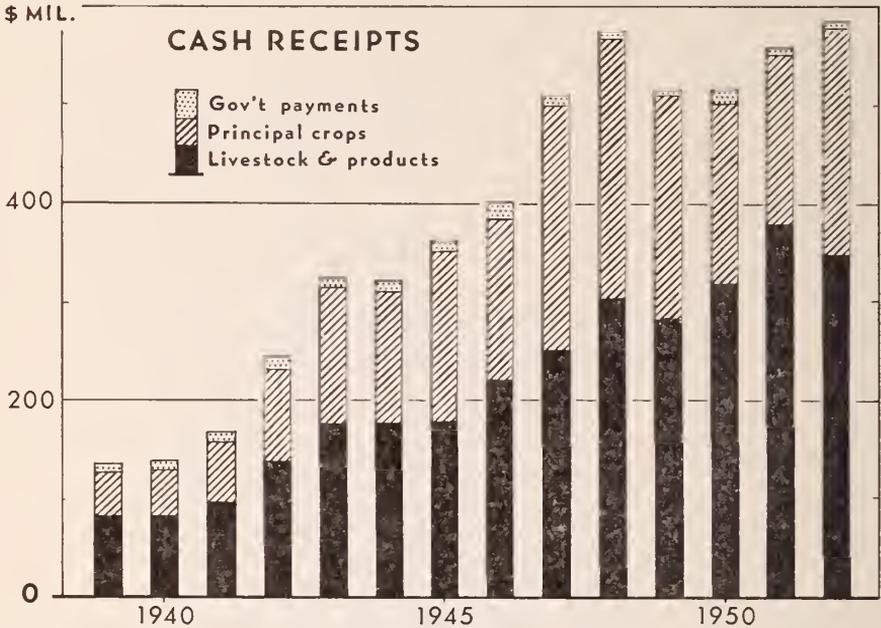

² Compiled from Minerals Yearbook of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

³ In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not separately available for security reasons.

NOTE.—For a discussion of the significance of this table, see page 4 of Colorado Agricultural Statistics, 1950.

¹ In certain years, production includes some quantities not harvested because of economic conditions and, excluded in computing value.² Estimates of commercial apples relate to production in 7 commercial counties (Larimer, Delta, Garfield, Mesa, Montezuma, Montrose and Fremont), which produce about 95 percent of the total apples produced in the state.

LIVESTOCK INVENTORY AND VALUE—JANUARY 1, 1953 and 1952

The total inventory value of all livestock including poultry reached a record high of \$449,828,000 on January 1, 1952. Reversing the upward trend of recent years, however, the aggregate value of all species of livestock combined was placed at only \$296,770,000 on January 1, 1953. This was one-third less than the record high of a year earlier. This decline of nearly 153 million dollars was the largest ever experienced by the livestock industry in a twelve month period. With the exception of cattle, numbers of all species declined in 1952. Values per head in January 1953 were considerably under January 1952 for all species except horses and mules.

Cattle and Calves—The number of all cattle and calves on January 1, 1953 totalled 2,161,000 head, a record high level and 3 percent above the 2,098,000 head on hand a year earlier. The 1953 number was 20 percent greater than the 1942-51 average. Each age and sex group contributed to the general inventory increase.

In the western half of the state the grazing season was favorable in 1952 and there was a good supply of hay and feed grains. This made it possible to hold back cattle and expand the inventory. There was also a good supply of feed in eastern irrigated areas, especially the northeastern area where there was an adequate quantity of sugar beet by-products and a record tonnage of corn silage. This resulted in 296,000 cattle and calves being in feed lots on January 1, 1953 and nearly equivalent to the record 300,000 head on January 1, 1952. Stock cattle numbers were well maintained even in the drought stricken east central and southeastern sections of the state as stockmen were reluctant to sell at late 1952 low prices. A good many cattle were moved out of that territory but much hay was also shipped in. Mild weather favored inventory retention.

Average value per head of cattle and calves dropped sharply during 1952 to reach the lowest point since 1947. On January 1, 1953 the average was \$117.00 compared with the record high of \$177.00 a year earlier, and the 1942-51 10-year average of \$95.80 per head. Value of the entire cattle inventory January 1, 1953 set at \$252,837,000 presents a most unfavorable comparison with the January 1952 record high value of \$371,346,000.

A total of 182,000 milk cows two years of age and over on January 1, 1953 was slightly larger than the 180,000 on hand a year earlier but was 18 percent less than the 10-year average of 223,000 head. A higher average production of

milk per cow has offset much of the basic loss of milk flow resulting from reduced numbers. Value per head at \$199.00 on January 1, 1953 marked a sharp drop from the record high level of \$264.00 attained a year earlier. Total value was \$36,218,000 against \$47,520,000 the previous year and \$29,927,000 the 1942-51 average. Heifers one to two years old being kept for milk cows numbered 48,000 head, down 13 percent from the January 1, 1952 inventory. Heifer calves for milk stock showed a moderate increase from a year earlier.

Sheep and Lambs—Numbers of stock sheep increased again during 1952 marking the second year of increased numbers since the downward trend began in 1942. Record high numbers were attained in that year with an estimated 1,889,000 head of stock sheep on Colorado farms and ranches. An inventory of 1,338,000 head on January 1, 1953, although considerably under the record number, was the largest inventory recorded since 1946. This total was 3 percent larger than the 1,299,000 head on hand a year earlier, but was 10 percent smaller than the 1942-51 average of 1,479,000 head.

An average value of \$18.20 per head was placed on the inventory at the beginning of 1953. This value was 47 percent under the value of \$34.10 placed on the inventory one year earlier. The aggregate value of stock sheep was \$24,352,000 January 1, 1953. This compared with \$44,296,000 January 1, 1952 and \$22,339,000 the 1942-51 average.

Although there was considerable feed distress in the drought stricken plains area of the southeastern quarter of Colorado in the summer of 1952, conditions were generally quite good as related to range feed, hay, grain and other feed in the areas where most Colorado sheep are located. The eastern plains section has only about $\frac{1}{2}$ to $\frac{1}{3}$ of the stock sheep inventory. Sheep raisers suffered a severe squeeze between rising costs and declining prices for both sheep and wool during 1952. Fortunately, however, this condition had more the effect of being a destroyer of profits rather than effecting forced liquidation or bankruptcy.

The number of sheep and lambs in feed lots January 1, 1953 totalled 500,000 head compared with 625,000 a year earlier. An average January 1, 1953 inventory value of \$17.00 per head for sheep and lambs on feed was 45 percent under the corresponding 1952 value of \$31.00. Aggregate inventory value of lambs in feed lots was only \$8,500,000 January 1, 1953. This was less than half that of a year earlier at \$19,375,000.

Hogs and Pigs—Hog numbers declined for the third consecutive year during 1952 to reach an estimated 218,000 head on January 1, 1953, the lowest inventory since 1913. This number was 27 percent smaller than the 299,000 head on hand January 1, 1952, and 46 percent under the 1942-51 average of 405,000 head. Value per head at \$21.30 was well below both the January 1, 1952 average of \$25.60 and the 10-year average of \$26.00. Total value of hogs on hand January 1, 1953 was \$4,643,000 compared with \$7,654,000 a year earlier and \$9,613,000 the 10-year average.

The combined spring and fall pig crops of 1952 totalled only 366,000 pigs saved, the smallest annual pig crop since 1938. The 1952 spring pig crop was estimated at 216,000 pigs farrowed from 36,000 sows. The 1952 fall crop was 150,000 pigs farrowed from 23,000 sows.

The short supply of feed grains of all kinds in 1952 together with the unfavorable hog-feed ratio took the profit out of the hog business and was largely responsible for this sharp additional curtailment in hog production.

Horses and Mules—Horse numbers were further reduced during 1952 to continue the decline which began in 1920. The inventory January 1, 1953 fell below the 100,000 mark for the second time since 1883. The current number estimated at 87,000 head was 10 percent less than the 97,000 head on farms and ranches in January, 1952, and was little more than half the 1942-51 average of 165,000 head of horses and colts. Saddle horses and cow ponies account for fully half the present horse and colt inventory. Average value per head of all horses and colts January 1, 1953 at \$34.00 was 10 percent above the average at the beginning of 1952.

Mule numbers at 4,000 head have remained unchanged for several years. The high point in the mule inventory was reached in 1924 when Colorado recorded a mule population of 38,000 head.

Calf Crop—A record number of calves were born in beef and dairy herds during 1952. The total calf crop of 783,000 head exceeded the 1951 crop by 3 percent. This large calf crop resulted from a high percentage of calves being dropped from a record high number of cows and heifers of breeding age at the beginning of 1952. There was a further increase in the number of cows and heifers of breeding age on January 1, 1953. This indicates that a new record calf crop may be born during 1953.

Lamb Crop—For the second successive year, the number of lambs saved increased over the preceding year. The 1952 lamb crop totalled 984,000 head, slightly higher than the 1951 crop of 975,000 lambs saved. An estimated 96 lambs per 100 ewes of breeding age was recorded for the 1952 season. This was only 1 percent under the 1951 record high of 97 lambs per 100 ewes 1 year old and over and had not been equalled or exceeded in any year other than 1951. Despite fairly heavy losses of ewes from January to July, the high lambing percentage was reached through an unusual number of twins and triplets. A generally good number of survivals was also recorded.

Wool—Wool production during 1952 totalled 11,688,000 pounds, about 1 percent more than the 1951 output of 11,580,000 pounds. Although only slightly larger than a year earlier, the 1952 outturn marks the fourth consecutive year of increase and was the largest crop produced since 1946. Total value of the 1952 wool clip was \$6,078,000, little more than half the record high 1951 clip worth \$11,580,000. Wool producers were faced with declining prices during 1952 for both wool and sheep while costs of production continued to rise. Most of the 1952 wool clip went under Government loan.

Weight per fleece in 1952 averaged 9.1 pounds. This was exceeded only by the 9.6 pound average of 1951 and had been equalled only twice in previous years. The number of sheep and lambs shorn in 1952 was estimated at 1,286,000 head, 7 percent more than the 1,200,000 head shorn in 1951. The average price per pound received for wool by producers in 1952 was 52 cents. While this was only about half the \$1.00 per pound received for the 1951 clip, it is 21 percent higher than the 1941-50 average price.

Chickens and Eggs—An unfavorable egg-feed ratio caused the chicken inventory to decline to an unusually low level. The number of chickens on farms January 1, 1953 totalled only 2,502,000 birds. This was 11 percent below the January 1, 1952 total of 2,802,000. Numbers of chickens raised declined to the lowest level since 1935 with only 5,043,000 raised during 1952. This compares with 5,933,000 raised in 1951 and 5,115,000 in 1950. The high point in chicken production was reached in 1943 with 9,668,000 birds raised in that year.

Farm consumption of chickens during 1952 totalled 1,530,000 birds valued at \$1,085,000. A total of 3,253,000 farm raised chickens were sold from the farm during 1952 for a total of \$2,499,000. Total value of production was \$3,354,000, 28 percent under the 1951 value of \$4,680,000. Value of the chicken inventory on January 1, 1953 was \$3,002,000, half a million under the inventory value on the same date a year earlier.

Although the number of pullets and hens was smaller, a record high average of 147 eggs per layer resulted in an increase in the number of eggs produced. A total of 393 million eggs were laid during 1952 as compared with 383 million a year earlier. Aggregate value of 1952 egg production was down from the preceding year, however, due to a decline in price of over 5.5 cents per dozen. Value of 1952 production was placed at \$13,067,000, considerably under the 1951 value of \$14,522,000. Eggs sold from the farm during 1952 were valued at \$10,673,000 and those consumed on the farm at \$2,361,000.

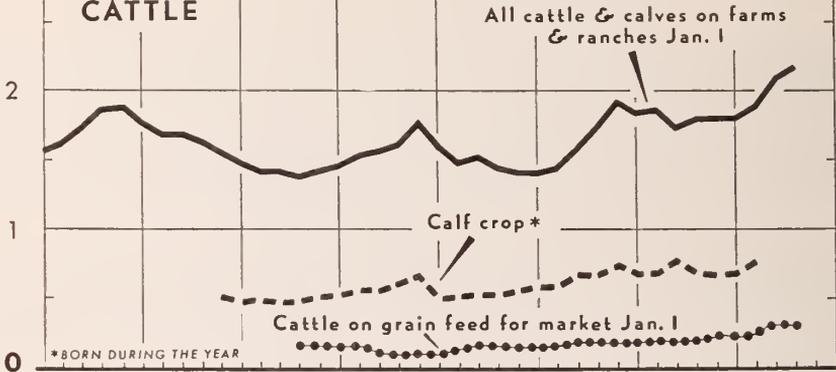

The commercial broiler industry has increased sharply in recent years. However, the industry reported no significant changes during 1952 in comparison with 1951. The total number produced in each year was 2,129,000 birds. Average weights were somewhat lower in 1952 than in 1951, however, and a 3 percent decline in the poundage recorded, the totals being 6,174,000 pounds in 1952 and 6,387,000 pounds in 1951. The price per pound averaged 31 cents for the third successive year. Gross income declined from \$1,980,000 in 1951 to \$1,914,000 in 1952.

Turkeys—For the third year in succession the number of turkeys raised remained unchanged at 723,000 birds. A decline of nearly 4 cents per pound in price resulted in a drop in the total value of production from \$5,452,000 in 1951 to \$4,563,000 in 1952. Cash income from sales fell from \$5,263,000 in 1951 to \$4,556,000 in 1952 and the value of turkeys consumed on farms declined from \$113,000 to \$82,000. Breeder hens held over until January, 1953, reached the lowest figure in 13 years at 10,000 birds.

¹ Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

² Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

³ Value of combined sales plus value of products consumed in the farm household.

¹ Compiled from reports of the Colorado Tax Commission.² Number assessed as "fed in transit" are not included.

WHY CROP AND LIVESTOCK REPORTS

- A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.
- They aid farmers in planning their production and marketing.
- They are essential in enacting wise legislation affecting Agriculture.
- They are the basis for analysis of agricultural and other business conditions.
- They enable railroads to make a better distribution of cars for moving farm products.
- They give producers the same foresight to future price trends that organized dealers possess.
- They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.
- They are indispensable in times of war because food is as essential as ammunition and weapons of war.
- They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.
- They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.
- They give information on surplus and deficit areas of production making possible a more economical distribution of products.
- They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.
- They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.
- They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.
- They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.
- They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.
- They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.

LAND CLASSIFICATION OF COLORADO

- Irrigated land
- ▤ First class dry farming
- ▥ Second class dry farming
- ▦ Third class dry farming
- ▧ Sand hills
- ▨ National forests
- ▩ National parks
- Grain crop land
- Grazing land
- ▬ Forage crop land
