REVIEW OF THE 1959 CROP SEASON

Production of field crops during 1959 in Colorado was below the large 1957 and 1958 quantities harvested but was above average. The winter wheat and winter barley crops were large and contributed greatly to the total crop output. Sugar beet production was the largest since 1947 and was one-third larger than average. Corn production was 69 percent above average and the second largest since 1930. Sorghum grain production was below that of 1957 and 1958 but was the third largest of record and more than double the 1948-57 average. Potato and hay crops were a little larger than average. Broomcorn exceeded the low 1958 crop by 57 percent but was below average. The non-irrigated spring barley crop was small but total barley production was above 1958 and average. Spring wheat, oats, dry beans, and dry peas dropped well below 1958 and average.

Lower yields per acre for most crops, in addition to a smaller total acreage of crops harvested in 1959 than in 1958, accounted for the lower total crop output. Acreages of principal crops harvested in 1959 totaled 5,948,000 acres compared to 6,280,000 acres in 1958. The reduction in acreage harvested was the result of increased participation in the Conservation reserve program.

The 1959 season started with generally favorable conditions for seeding winter wheat, barley and rye in the fall of 1958. Fall seeded grains came through the winter in good condition with very little loss of acreage. Cool early spring weather retarded planting and growth of spring small grains and sugar beets. High temperatures and drying winds in June forced maturity of winter barley and winter wheat and reduced yields on much of the acreage. Hail also did some early season damage. Harvest of winter grains was rapid. Continued dry weather during July and August damaged much of the non-irrigated beans, sorghums and corn although rainfall in the extreme southeast was adequate for good sorghum and broomcorn crops. Irrigation water was short in some localities, mainly in the southwest and south-central areas, but irrigated crops generally produced well. Liberal moisture the last of September and during October delayed harvest of late crops and resulted in a very difficult harvest for sugar beets. All crops were harvested without significant loss but quality on late beans was reduced. Winter grain seedings for 1960 harvest got off to a fair to good start.

Cash receipts from sale of all farm products, totaled about \$593 million in 1959. This compared with the \$589 million in 1958, \$455 million in 1957, and the record high of \$602 million in 1952.

WHEAT—Winter wheat production in 1959 amounted to 53,746,000 bushels compared to the record high in 1958 of 66,274,000 bushels and the 1948-57 average of 35,421,000 bushels. The 1959 crop was the fifth largest ever harvested in Colorado. The yield averaged 22.0 bushels per harvested acre, 3.5 bushels less than in 1958 but 6.2 bushels above the 1948-57 average. The area harvested was 2,443,000 acres in 1959, 6 percent below the 2,599,000 acres in 1958 but 11 percent above the 10-year average of 2,204,000 acres. The harvested area was comparatively large in both 1958 and 1959 because of relatively small abandonment. Soil moisture supplies were generally favorable for seeding in the fall of 1958 although some northeast sections were short of surface moisture and had to replant after moisture was received. Area seeded for the 1959 crop was 2,655,000 acres and was much below average. Prospects were very promising in the spring with good stands and heavy straw growth, but hot dry weather for an extended period in June caught the acreage in east central Colorado in the dough stage which forced ripening and reduced yields. Weather was favorable for a rapid harvest. Protein content was high and most wheat was good quality. Spring wheat production at 816,000 bushels was very low. The 1958 crop was 931,000 bushels and the 1948-57 average was 1,610,000 bushels.

POTATOES—Potato production totaled 11,760,000 cwt. in 1959. This was 13 percent less than the record harvest of 13,505,000 cwt. in 1958, but was 13 percent greater than the 1949-57 average of 10,387,000 cwt. The fall potato crop was 9,000,000 cwt., 15 percent less than the 1958 crop

of 10,557,000 cwt. The 9-year average was 8,125,000 cwt. There were 45,000 acres harvested compared to 45,900 in 1958. Average yield was 200 sacks per harvested acre in 1959 against 230 sacks in 1958. The 1959 acreage was near the average of 43,600 but yield per harvested acre exceeded the average by 14 sacks. Potatoes for fall harvest were planted "on time." Short supplies of natural water necessitated heavy use of pumps in the San Luis Valley and yields were restricted somewhat. Killing frosts also occurred there earlier than normal, further restricting yields per acre. Quality was good but tuber size was smaller than in 1958. Production of late summer potatoes amounted to 2,760,000 sacks, 6 percent less than the 2,948,000 sacks harvested in 1958, but 22 percent more than the 1949-57 average. The harvested acreage totaled 12,000 acres compared to 13,100 acres in 1958, and the 9-year average of 10,300 acres.

SUGAR BEETS—Production of sugar beets amounted to 2,437,000 tons, the largest since 1947. The 1958 harvest was 2,372,000 tons and the 10-year average 1,881,000 tons. Both acreage and yield per acre were higher than in 1958 and the 10-year average. Yield averaged 17.0 tons on the 143,200 acres harvested in 1959. In 1958 the yield was 16.7 tons on 142,100 acres. The 10-year average was 119,200 acres and 15.8 tons. Sugar beets did very well in all areas in 1959. There was some delay in planting in northern Colorado and part of the acreage was replanted. However, growth and development during the summer was very favorable. Harvest was extremely difficult and prolonged as stormy weather covered most of the area just as harvest started. Fields were muddy and part of the time ground was frozen. Some harvest extended into mid-December.

DRY BEANS—Dry bean production was estimated at 1,646,000 bags (100 pound clean basis) compared to 1,882,000 bags harvested in 1958 and the 1948-57 average of 1,864,000 bags. A reduction in harvested acreage in 1959 accounted for the below average crop. In 1959 harvested acreage was 211,000 acres in comparison with 251,000 acres in 1958 and 232,000 acres average. Irrigated yields averaged 1,700 pounds in 1959 against 1,410 in 1958. Non-irrigated yields were 210 pounds in 1959 and 360 in 1958. Harvest of eastern irrigated beans was completed earlier than usual although extremely dry weather resulted in some shattering. Quality was good. Non-irrigated beans were short of summer moisture. Production in the southwest was 191,000 sacks against 413,000 in 1958. Production in the low west central valleys was 181,000 bags in 1959 compared to 173,500 in 1958. Heavy snows the end of September and early October caused some quality damage to late harvested beans.

CORN—Production of all corn was estimated at 26,182,000 bushels compared to 25,725,000 bushels in 1958 and the 1948-57 average of 15,511,000 bushels. The 1959 crop was the second largest since 1930. Harvested acreage declined from 525,000 acres in 1958 to 494,000 acres in 1959 with the reduction on non-irrigated land. Irrigated corn yielded well with the average at 69 bushels per harvested acre compared to 63 bushels in 1958 (and Iowa's 65 bushels average). Non-irrigated corn was short of moisture during the summer and averaged 14.5 bushels per harvested acre compared to 20 bushels in 1958. Production of corn harvested for grain was 15,606,000 bushels in 1959 and 16,530,000 bushels in 1958 and 8,646,000 bushels average. Silage totaled 1,944,000 tons against 1,872,000 in 1958 and 2,619,000 tons in record 1957. Ten years previous silage production ruled less than one million tons.

OATS AND BARLEY—Barley production of 15,341,000 bushels was 12 percent above the 1958 harvest of 13,664,000 bushels and 34 percent above average. There was a sharp increase in winter barley acreage for 1959 which yielded well although hot, dry weather in June restricted yields. Spring barley made good yields on irrigated land but the small acreage on non-irrigated ground was near failure. The 1959 oats crop amounted to 4,140,000 bushels, 19 percent less than the 5,106,000 bushels in 1958 and 17 percent less than the average of 5,000,000 bushels.

SORGHUMS—Grain sorghum production was 9,292,000 bushels compared with the large 1958 crop of 12,450,000 bushels and the 1957 record crop of 16,400,000 bushels, and was more than double the 1948-57 average. Production of forage was 213,000 tons compared to 278,000 tons in 1958

and 365,000 tons average. The acreage harvested for all purposes at 653,000 acres was down 16 percent from the 777,000 acres in 1958. Most of the reduction in acreage was in non-irrigated sorghums. Irrigated sorghums had another good season and averaged 49 bushels. Non-irrigated sorghums did very well in Baca County but in other eastern sections, summer precipitation was inadequate. Harvest of sorghums in 1959 was slow due to high moisture content.

BROOMCORN—Broomcorn production was estimated at 7,200 tons in comparison with 4,600 tons in 1958 and the 10-year average of 7,570 tons. Area harvested was 48,000 acres versus 40,000 acres, in 1958 and was below average. Moisture was adequate and the average yield was 300 pounds per harvested acre compared to 230 pounds in 1958 and 210 pounds average. Quality was generally good.

SEED CROPS—Production of alfalfa seed in 1959 was estimated at 2,340,000 pounds compared to 2,240,000 pounds in 1958 and the 1948-57 average of 2,958,000 pounds. Production of sweetclover seed amounted to 486,000 pounds in 1959, and was the smallest crop since 1934. The 1958 crop totaled 1,350,000 pounds and the 1948-57 average was 1,887,000 pounds. The sudangrass seed crop totaled 4,640,000 pounds, 35 percent below the 1958 crop of 7,150,000 pounds and 62 percent below the 10-year average of 12,210,000 pounds.

HAY CROPS—Total hay production was 2,559,000 tons compared with 2,652,000 tons in 1958 and 2,352,000 tons the 10-year average. Acreage harvested at 1,436,000 acres was less than in 1958 and the 10-year average. Production of alfalfa was 1,852,000 tons in 1959 and 1,930,000 in 1958. Quality of the 1959 hay crop was generally good although there was some weather damage in mountain areas. Hay and roughage supplies were generally adequate for wintering the livestock inventory but there were local shortages in east central Colorado and parts of the southwest where hay was hauled in.

FRUIT CROPS—The 1959 season was favorable for peaches and pears, but the apple and sour cherry crops were quite short. Production of peaches was estimated at 1,670,000 bushels compared to 1,820,000 bushels in 1958 and 1,682,000 bushels average. Commercial apple production was 1,000,000 bushels against 1,520,000 bushels in 1958 and 1,262,000 bushels the 1948-57 average. Pears totaled 190,000 bushels compared to 210,000 bushels in 1958 and 188,000 bushels average. Production of sour cherries was 1,350 tons compared to 1,770 tons in 1958 and the average of 1,975 tons in 1948-57 period. Sweet cherry production of 620 tons was near the 10-year average of 597 tons but well below the large 1958 crop of 1,100 tons.

COMMERCIAL VEGETABLES

1959 Season

The characteristics of the 1959 season and factors having a bearing on 1959 production were reviewed in detail on pages 8 to 10 of the 1958-59 edition of Colorado Agricultural Statistics published in April 1960. A further resume of the 1959 commercial vegetable deal in this issue would be largely repetition. However, pertinent statistics relating to acreage, production and value of individual crops produced in 1959 are given as comparable data in the Review of the 1960 Season found subsequently in this text and in the statistical tables for each vegetable crop.

REVIEW OF 1960 CROP SEASON

Preliminary Estimates

Total field crop production in Colorado in 1960 was much above 1959 due largely to the near-record winter wheat crop. Also contributing greatly was the largest barley crop since 1949; the largest sugar beet production since 1930; rye, potato, and all hay output above 1959 and the 1949-58 average; and oats, dry bean and field pea crops above the 1959 level. Corn and sorghum grain production was below 1959 total outturn but was much above average. Broomcorn was sharply below both 1959 production and average. Spring wheat was slightly lower than in 1959 and much below average.

Higher yields per acre for most crops in 1960, compared to 1959, more than offset the slightly lower total acreage of crops harvested. Winter wheat and sugar beet yields per acre were the highest of record. Oats and all corn yields equaled the previous high record. The 1959 season was very good for small grains and most irrigated crops, but dry weather during the summer cut yields on late maturing non-irrigated crops. The 1960 crop output was obtained from 5,931,000 acres harvested, against 5,948,000 acres harvested in 1959.

Moisture for seeding winter grains the fall of 1959 was short until late September. A large portion of winter grain acreage made little growth before winter started. Winter wheat experienced minimum winter kill but winter barley was severely damaged in some northeastern sections which resulted in abandonment of thin stands. Warm temperatures in April, timely rains during the growing season and ideal harvest weather combined to produce excellent winter grain yields in major producing sections of the state. Harvest of small grains was rapid. Water supplies were adequate in northern irrigated areas but became scarce late in the season in the Arkansas and San Luis Valleys. Pump irrigation was used extensively in the San Luis Valley as natural water supplies became low. Late maturing non-irrigated crops were severely hampered by hot, dry weather, which persisted from July through September. A large portion of the non-irrigated corn and sorghum acreage was cut for forage or pastured. Harvest weather was ideal until October 10 when the first snow storm of the season halted operations for a few days. Weather during November was favorable and harvest was completed with no undue losses.

The preliminary estimate of cash receipts from sale of all farm products in 1960, including livestock and livestock products was \$609 million, a new record high. This compared with the 1959 total of \$593 million, 1958 total of \$589 million and the previous record high of \$602 million in 1952.

WHEAT—Production of winter wheat in 1960 amounted to 65,313,000 bushels, 79 percent above the 1949-58 average of 36,531,000 bushels and the second highest production of record. In 1959, production was 53,746,000 bushels and the 1958 record high was 66,274,000 bushels. A record high yield of 27.0 bushels per harvested acre in 1960 compared to 22.0 bushels in 1959, 25.5 bushels in 1958 and 16.4 bushels average. The 2,419,000 acres harvested in 1960 nearly equalled the 2,443,000 acres in 1959 but was below the 2,599,000 acres in 1958. Seedings of winter wheat the fall of 1959 totaled 2,575,000 acres against 2,655,000 in 1958 and 3,242,000 acres average. Fall growth of the winter wheat crop was somewhat restricted by a lack of moisture early in the fall and cool weather in October. Snow cover through most of the winter held acreage losses to a minimum. Warm temperatures with little wind allowed wheat to become well established in April. Rainfall was timely during the growing season and the crop developed extremely well. Harvest was mostly dry and rapid. Quality of the 1960 crop was good—test weights were unusually heavy, contributing to the record yield. Spring wheat production at 808,000 bushels compared with 816,000 in 1959 and 1,484,000 bushels, the 10-year average.

POTATOES—A potato crop of 11,922,000 cwt. was harvested in 1960. This was 1 percent above the 11,760,000 cwt. in 1959 and 11 percent above the 10,698,000 cwt. average. The fall potato crop totaled 9,503,000 cwt. compared to 9,000,000 cwt. in 1959 and 8,368,000 cwt., the 10-year average. There were 44,200 acres of fall potatoes harvested in 1960 compared to 45,000 in 1959. The fall crop was planted "on time." Irrigation water supplies in the San Luis Valley were adequate although pump irrigation was used heavily as natural water became short. Killing frost in October was later than normal. The yield of 215 sacks per acre exceeded the 1959 yield of 200 sacks and the 10-year average of 190 sacks. Quality was good and potatoes went into storage in very good condition. Prices were good. The late summer potato crop totaled 2,419,000 cwt. compared to 2,760,000 in 1959 and 2,330,000 average. Harvested acreage in 1960 was 11,800 acres, slightly less than the 12,000 acres in 1959 but above the average of 10,600 acres. Quality of the late summer crop was excellent and the crop moved rapidly. Yield at 205 sacks was below both the 1959 yield of 230 sacks and the 10-year average of 220 sacks.

SUGAR BEETS—Sugar beet production totaled 2,761,000 tons compared to 2,437,000 tons in 1959 and the 10-year average of 1,980,000 tons. A record

high yield of 17.8 tons per acre was obtained and production was the largest since 1930. Yield in 1959 was 17.0 tons and the 10-year average was 16.1 tons. Harvested acreage in 1960 at 155,100 acres compared to 143,200 acres in 1959 and 123,100 acres average. Sugar content was high and beets did exceptionally well in the northern area. The crop was planted early and made rapid growth. Irrigation water supplies were generally adequate. Harvest started under favorable conditions but snow and rain the second decade of October hampered progress. Mild clear weather most of November permitted harvest to be completed without undue delay.

DRY BEANS—Production of dry beans (supported by reports of beans cleaned) was estimated at 1,736,000 bags (100 pound clean basis) compared to 1,646,000 bags harvested in 1959 and the 1949-58 average of 1,838,000 bags. The 1960 crop was harvested from 217,000 acres averaging 800 pounds per acre. In 1959, 211,000 acres were harvested averaging 780 pounds per acre. Irrigated acreage yields averaged 1,660 pounds in 1960 compared to 1,700 pounds last year and 1,498 pounds, the 1949-58 average. Dryland bean yields averaged 260 pounds in 1960 compared to 210 pounds in 1959 and 354 pounds, the 10-year average. Harvest of eastern irrigated dry beans was completed early with harvest and threshing weather ideal. Non-irrigated beans in the southwest were short of summer moisture which reduced yields. Even so, harvest weather was generally good and the final yield outturn was better than experienced in 1959. Quality of the dry bean crop was generally good.

CORN—Total corn production was estimated at 23,850,000 bushels, 9 percent below 1959 production of 26,182,000 bushels but 42 percent above the 10-year average of 16,831,000 bushels. The 1960 yield at 53.0 bushels equaled the record high established in 1959 and compared to the 1949-58 average of 34.3 bushels. Irrigated corn did very well, yielding 69.5 bushels per harvested acre compared to 69.0 bushels in 1959. Non-irrigated acreage was short of moisture during the summer and yielded only 13.0 bushels compared to 14.5 bushels in 1959. Only 56 percent of the 1960 total acreage was harvested for grain compared to 62 percent in 1959. The corn "for grain" crop totaled 12,424,000 bushels, 20 percent smaller than the 1959 crop of 15,606,000 bushels but 31 percent above the 10-year average of 9,518,000 bushels. Silage production at 2,236,000 tons compared to 1,944,000 tons in 1959.

OATS AND BARLEY—Barley production at 18,513,000 bushels was sharply above the 1959 crop of 15,341,000 bushels and the 10-year average of 11,433,000 bushels. The 1960 crop, third largest of record, was the largest since 1949 when 22,143,000 bushels were harvested. About 60 percent of the total acreage was winter barley. Many winter barley stands were thin but yields were good. Spring barley also yielded well. Oats production at 4,902,000 bushels compared to 4,140,000 bushels in 1959 and 4,929,000 bushels average. Favorable weather during the critical growing period resulted in high yields and heavy test weights. Yield at 38.0 bushels per acre in 1960 compared to 36.0 bushels in 1959, 31.4 bushels average and equalled the previous record high.

SORGHUM—A sorghum grain crop of 7,344,000 bushels was harvested in 1960 against 9,292,000 bushels in 1959 and 5,369,000 bushels average. Forage production was 232,000 tons compared to 213,000 tons in 1959 and 364,000 tons average. Silage production at 202,000 tons was above both 1959 at 148,000 tons and average at 143,000 tons. Harvested acreage for all purposes totaled 627,000 acres in 1960 and 653,000 acres in 1959. Irrigated sorghum grain averaged 51.0 bushels compared to 49.0 bushels in 1959. Dry weather reduced non-irrigated yields to 13.0 bushels, similar to 1959 outturn of 14.0 bushels but below 1958 at 17.5 bushels. A large percentage of the non-irrigated crop was pastured or cut for forage. Harvest of most sorghums for grain was completed during November under favorable conditions.

BROOMCORN—Broomcorn production in 1960 totaled 4,920 tons against 7,200 tons in 1959, and 7,040 tons average. Acreage harvested at 41,000 acres compared to 48,000 in 1959 and 68,000 acres average. Yield at 240 pounds was below the 1959 yield of 300 pounds but above the 10-year average of 203 pounds. Quality of brush was good and a large portion was sold before December 1, 1960.

SEED CROPS—Alfalfa seed production in 1960 was estimated at 1,690,000 pounds compared to 2,340,000 pounds in 1959 and the 1949-58 average of 3,052,000 pounds. Area harvested in 1960 at 13,000 acres was sharply below 1959 acreage of 18,000 acres and the 10-year average of 24,400 acres. Quality of the 1960 crop was generally good but production was short in most sections due to dry weather. Yield was 130 pounds per harvested acre in 1960 and 1959 compared to 128 pounds for the 1949-58 average. Sweetclover seed production in Colorado at 432,000 pounds in 1960 was the smallest crop since 1934. The 1959 crop totaled 486,000 pounds and the 1949-58 average was 1,672,000 pounds. Acreage harvested in 1960 at 2,700 acres was the same as in 1959 but much below the average of 7,080 acres. Yield at 160 pounds was 20 pounds below the 1959 yield. Moisture shortages accounted for the short crops in both 1960 and 1959. The sudangrass seed crop totaled 7,800,000 pounds in 1960, 68 percent above the 1959 crop of 4,640,000 pounds but 37 percent below the 1949-58 average production of 12,425,000 pounds. Acreage harvested in 1960 at 26,000 acres compared to 16,000 acres harvested in 1959 and the 10-year average of 39,800 harvested acres. At 300 pounds, the yield per harvested acre was 10 pounds above 1959 and 16 pounds above average. Prices received by farmers for the 1960 crop to December 1 averaged approximately \$4.20 per cwt. compared to the final 1959 season average price of \$4.00 per cwt. The increase in acreage this year was the result of somewhat better prices which came about because of a reduction in carryover from the large 1957 crop.

HAY CROPS—A total of 2,634,000 tons of all hay was harvested in 1960 versus 2,559,000 tons in 1959 and 2,392,000 tons average. Acreage harvested at 1,442,000 acres was about the same as in 1959 and average. The all hay yield at 1.83 tons compared to 1.78 tons in 1959 and 1.66 tons average. Alfalfa hay production in 1960 totaled 1,911,000 tons, 1,852,000 tons in 1959 and 1,663,000 tons average. Quality was generally good. Hay and roughage supplies (carryover plus production) were below recent years but adequate for normal winter feeding.

FRUIT CROPS—All fruit crops in 1960 were below 1959 and average as a result of severe freeze damage in April. Peach production at 710,000 bushels was 57 percent below the 1,670,000 bushels in 1959 and 58 percent below average. Quality was good. The commercial apple crop in 1960 amounted to 850,000 bushels, compared with 1,000,000 bushels in 1959 and 1,276,000 bushels average. The pear crop was almost a total loss at 25,000 bushels compared to 1959 at 190,000 and the average at 194,000 bushels. Sour cherry production at 750 tons compared to 1,350 tons in 1959 and 1,722 tons average. Sweet cherries were near failure at 120 tons, in contrast with 620 tons in 1959 and 625 tons, the 10-year average.

COMMERCIAL VEGETABLES

1960 Season

Colorado vegetable growers produced at a high level in 1960 despite unfavorable late spring weather and other unfavorable factors. In May and early June crops suffered severe hail damage in the Arkansas Valley, heavy freeze losses in the San Luis Valley and significant losses from both of these destructive hazards in Northern Colorado. However, this early backwardness was mostly offset by favorable growing conditions which prevailed through the summer and early fall months, resulting in most crops showing above-average yields per acre. The over-all average for all vegetables of 8.4 tons per acre is the highest yield of record. In 1960, Colorado ranked 14th among the states in the acreage harvested for fresh market but was up in 9th place in the total tonnage produced. A similar showing is observed in vegetables grown for processing with the State ranking 27th in acreage and 20th in volume of production. Such production achievement is noteworthy when considered in light of the fact that these vegetables are grown in a relatively short season and under widely diversified conditions at altitudes ranging from 3,500 feet to 8,000 feet above sea level.

The combined total of 38,950 acres of vegetables grown for fresh market and for processing in 1960 yielded an aggregate quantity of 326,950 tons valued at \$16,970,000. In 1959, 40,370 acres produced 318,450 tons worth \$17,371,000. The 1958 area harvested was 40,070 acres, production was

302,500 tons and the farm value of these crops was \$14,584,000. In comparison with 1959, the 1960 acreage was down 4 percent, production was up 3 percent and total value was off 2 percent. Compared with 1958, the 1960 acreage was 3 percent less, production was 8 percent more and value was 16 percent greater. The aggregate 1960 production was the largest output since 1949 when 367,600 tons were taken from 55,880 acres and marks the 6th consecutive year of increase since the "low" of 1954. Another significant comparison is that in 1949 it required 43 percent more acreage to produce only 12 percent more vegetables than were produced in 1960.

Another interesting fact is that revealed by comparison of the value per acre harvested for the various crops grown in 1960. As is always the case, celery holds first place with an average of \$1,093 per acre. (However, the cost of producing celery is exceptionally high.) Other crops produced dollar value per acre in the following order of importance: carrots \$806, onions \$710, tomatoes for fresh market \$540, cauliflower \$495, lettuce \$455, snap beans for fresh market \$440, cabbage \$377, cucumbers for pickles \$345, spinach \$303, green peas \$278, tomatoes for processing \$275, cantaloups \$238, snap beans for processing \$236 and sweet corn \$231. The weighted average for all of the above crops was \$436. It should be kept in mind that the differentials between the various vegetables are more or less offset by variations in the cost of producing and marketing each crop.

ONIONS—The 1960 onion crop of 2,523,000 cwt. was the largest harvest since 1949 and accounted for 39 percent of the total quantity and 36 percent of the aggregate value of all commercial vegetables grown in the State. In addition to holding top spot in Colorado's vegetable industry, the crop also stands high in the Nation, advancing to 3rd place among the 19 states in the late summer group by producing more than 13 percent of the Country's 1960-61 fall and winter onion supplies. The value of the 1960 crop was estimated in December at \$6,181,000. In 1959, production of 2,296,000 cwt. was appraised at \$4,707,000 and the 1949-58 average production was 1,874,000 cwt. worth \$4,277,000. An area of 8,700 acres was harvested in 1960 compared with 8,200 acres in 1959 and 7,620 acres, the 10-year average. In comparison with a year earlier, the acreage harvested was 2 percent smaller in the Arkansas Valley, about the same on the Western Slope and 21 percent larger in Northern Colorado. Growers in the latter district planted only 8 percent more acreage in 1960 than in 1959 but they harvested a larger portion of the plantings than they did in 1959. The 1960 crop was produced under extremely varied growing conditions. Unfavorable weather delayed planting operations and even prevented seeding of some intended acreage. Plant growth was retarded early in the season by low temperatures and soil crusting. In May and June destructive hail storms cut plants back to the ground over hundreds of acres in the Arkansas Valley and in Northern Colorado. Several hundred acres were abandoned but the bulk of this acreage was held with hopes of at least a fair recovery. The weather was very favorable for onions through the remainder of the season. Recovery was slow on the hailed acreage but a late fall permitted growth to continue well into October and the final outcome in most of these fields was surprisingly good. Bumper yields were obtained from a large portion of the undamaged acreage which resulted in setting the highest yield of record for the State.

LETTUCE—This crop is well established in second place of importance in the Colorado vegetable industry, accounting for 18 percent of the State's 1960 total vegetable production and 16 percent of the gross value of all vegetable crops. Colorado also ranked second in volume of production among the Nation's Summer Group of lettuce growing States. A total area of 6,000 acres harvested in 1960 produced 1,170,000 cwt. with a gross farm value of \$2,730,000 compared with 6,200 acres, 1,085,000 cwt. and \$4,394,000 in 1959 and 6,000 acres, 900,000 cwt. and \$897,000 in 1958. The 1949-58 average was 4,700 acres, 550,000 cwt. and \$1,357,000. Although growers produced 8 percent more lettuce in 1960 than in 1959, farm value of the crop was 38 percent less. Comparing 1960 with 1958, production was up 30 percent and crop value more than tripled. However, neither 1959 or 1958 may be considered equitable comparisons as the 1959 production and income was the greatest by far of any year of record dating back to 1918 and 1958 average price was the lowest since 1941. When compared with the 1949-58 average, 1960 acreage was 28 percent larger, yield was 68 percent higher and production and total value were more than double the 10-year averages. Grow-

ers suffered a double set-back in 1960. After obtaining the highest yield per acre and largest production of record, they were compelled to abandon a large quantity of good quality lettuce and to accept lower prices for the portion sold, because of excessive supplies at the National market terminals.

TOMATOES—Tomatoes grown for fresh market and for processing held third place rating in Colorado's vegetable output in 1960 with a combined production of 677,000 cwt. worth \$1,147,000. About 80 percent of this crop is utilized for processing which in 1960 amounted to 542,000 cwt. taken from 2,400 acres with a farm value of \$661,000 against 592,000 cwt., 3,400 acres and \$702,000 in 1959 and 472,000 cwt., 3,000 acres and \$566,000 the 10-year average. The 1960 fresh market crop totaled 135,000 cwt. worth \$486,000 against 142,000 cwt. and \$390,000 a year earlier and 165,000 cwt. and \$587,000 average.

CABBAGE—This fourth ranking Colorado vegetable crop provides 14 percent of the Country's late summer commercial cabbage supplies produced by a group of 10 states. The 2,000 acres harvested in 1960 produced 540,000 cwt. valued at \$754,000 against 2,400 acres, 576,000 cwt. and \$1,182,000 in 1959. The 10-year average was 3,210 acres, 776,000 cwt. and \$955,000.

CARROTS—In 1960, a total of 2,000 acres produced 310,000 cwt. of carrots worth \$1,612,000 compared with 1,900 acres, 304,000 cwt. and \$1,322,000 a year earlier and 1,700 acres, 227,000 cwt. and \$755,000 average. Colorado's 1960 crop accounted for about 37 percent of the Nation's recorded late summer commercial carrot supplies.

CANTALOUPS—Colorado was the largest producer of cantaloups in the late summer group of 9 states in 1960 with an output equal to almost one-fourth of the total supplies. A harvested area of 2,800 acres yielded 266,000 cwt. with a farm value of \$665,000. In 1959, 2,700 acres produced 230,000 cwt. worth \$552,000 and the 1949-58 average was 2,250 acres, 201,000 cwt. and \$396,000.

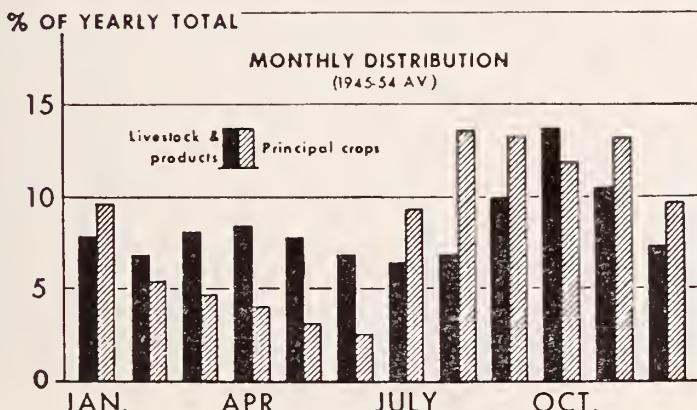

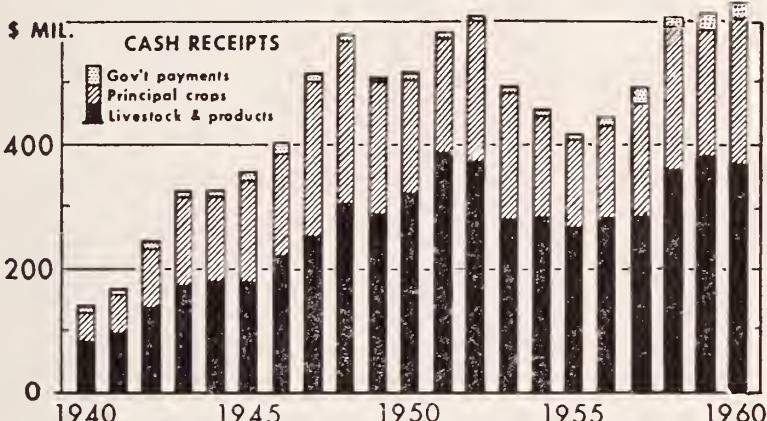

SNAP BEANS—Production of snap beans grown for processing in 1960 amounted to 92,000 cwt. valued at \$402,000 while the fresh market crop totaled 35,000 cwt. worth \$308,000. In 1959, the canning crop of 102,000 cwt. brought \$446,000 to growers and the fresh market output of 35,000 cwt. was worth \$332,000.

SPINACH—Colorado spinach might be said to hold the corner on the summer market as this is the only State in the Union on record as producing spinach in commercial volume during the summer season. In 1960, 2,300 acres yielded 127,000 cwt. valued at \$698,000 compared with 1,800 acres, 90,000 cwt. and \$450,000 in 1959. The 10-year average was 1,130 acres, 44,000 cwt. and \$194,000.

OTHER VEGETABLE CROPS—Acreage harvested and production respectively for 1960 compared with 1959 are as follows: **Cauliflower**: 750 acres and 116,000 cwt. in 1960 against 850 acres and 132,000 cwt. in 1959. **Celery**: 300 acres and 78,000 cwt. compared with 350 acres and 107,000 cwt. **Sweet Corn for Fresh Market**: 3,500 acres and 245,000 cwt. against 3,400 acres and 221,000 cwt. **Cucumbers for Pickles**: 1,200 acres and 173,000 cwt. compared with 1,500 acres and 263,000 cwt. **Green Peas for Fresh Market**: 950 acres and 33,000 cwt. against 900 acres and 31,000 cwt. During the summer period of 1960 Colorado provided 17 percent of the cauliflower and approximately half of the fresh market peas recorded as marketed in the country in commercial volume.

¹Data for 1954-59 are taken from the August, 1960 issue "Survey of Current Business" published by the U.S. Dept. of Commerce, under the heading "Personal Income by States and Regions." For detailed explanation of these estimates, see text in August, 1960 issue "Survey of Current Business," p. 17. Datum for 1960 is taken from the April, 1961 issue, p. 13.

²Compiled from Mineral Industry Surveys of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

³In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not included for security reasons.

⁴Unavailable.

⁵Preliminary.

⁶Unallocated—to avoid disclosing individual operations.

NOTE—For a discussion of the significance of this table, see page 4 of Colorado Agricultural Statistics, 1950.

¹Does not include stocks in merchant mills or bins owned by Commodity Credit Corporation.

²Includes stocks in interior mills, elevators, warehouses, commercial stocks at terminals and those owned by Commodity Credit Corporation in storage under CCC control.

³Unallocated—to avoid disclosing individual operations.

⁴Year shown refers to year of storage. For example: The 1,738,000 bushels of corn shown as in storage January 1, 1952, was produced in 1951 or earlier.

¹In certain years, production includes some quantities not harvested because of economic conditions and excluded in computing value.

²Estimates of commercial apples relate to production in 7 commercial counties (Larimer, Delata, Garfield, Mesa, Montezuma, Montrose and Fremont), which produce about 95 per cent of the total apples produced in the state.

³Not available.

⁴Included in "other variety" in previous years.

¹The figures for number on farms and total value are included in all cattle and calves.²These figures are included in all cattle and calves.³Intentions.**LIVESTOCK INVENTORY AND VALUE****January 1, 1961 and 1960**

Livestock inventory numbers in Colorado were lower on January 1, 1961 than on January 1, 1960. All cattle numbers decreased 1 percent during 1960 with both beef stock and dairy cows showing decreases. Cattle on feed for market were up 2 percent but the number of all other cattle was down 2 percent. Milk cows declined 3 percent from January 1, 1960 to January 1, 1961. Hog numbers decreased 12 percent. The inventory of stock sheep remained the same as on January 1 a year earlier. Numbers of sheep and lambs on feed were down 3 percent. January 1 chicken numbers declined 14 percent from a year earlier. Grain feed production in 1960 and also the combined tonnage of all hay and sorghum forage were above 1959 and the 10-year average. However, the carryover of roughage feed was below the previous year, particularly in the eastern sections of Colorado. The aggregate value of all livestock (including cattle and sheep on feed but excluding horses and mules) and poultry January 1, 1961 was \$339,689,000. This was above the 1960 inventory value of \$338,813,000 by less than 1 percent. For the 1950-59 period, the average January 1 inventory valuation was \$291,861,000. The record high of \$446,641,000 occurred January 1, 1952.

ALL CATTLE AND CALVES—Cattle and calves on Colorado farms and ranches January 1, 1961 totaled 2,240,000 head (including animals in feedlots). This was the second highest January 1 inventory on record. The 1961 January level was only 1 percent below the record 2,267,000 head January 1, 1960 and was 10 percent above the 1950-59 average of 2,028,000 head. Cattle and calves January 1, 1961 excluding animals on feed for market totaled 1,826,000 head. This was 2 percent below the revised estimate of 1,863,000 head for January 1, 1960. (The estimate of 1,863,000 head for January 1, 1960 is a revision from the preliminary estimate of 1,997,000 head).

There has been a general upward trend in the number of range and stock beef cattle and calves since 1940 when the number was 925,000 head. On January 1, 1961 this number totaled 1,600,000 head, or 2 percent below the record 1,633,000 head on Colorado farms and ranches January 1, 1960. At 780,000 head, beef cows exceeded the January 1, 1960 inventory of 757,000 by 3 percent. Beef heifers 1-2 years old totaled 151,000 head on January 1, 1961 compared with 158,000 a year earlier—a decrease of 4 percent. Calves (other than milk heifers) totaled 527,000 head January 1, 1961 in comparison with 557,000 head on January 1 a year earlier. The January 1, 1961 inventory of steers over 1 year at 92,000 head was 19 percent below the 114,000

head on hand January 1, 1960. In addition to the above, there were 414,000 head of cattle and calves on feed for market January 1, 1961—2 percent above the 404,000 head on feed a year earlier. Average value per head for all cattle January 1, 1961 was \$135.00 compared to \$131.00 January 1, 1960, and \$158.00 two years earlier. Total value of all cattle and calves amounted to \$302,400,000 January 1, 1961 in comparison with \$296,977,000 a year earlier, an increase of 2 percent.

CATTLE IN FEEDLOTS—There were 414,000 head of cattle and calves being fattened in Colorado feedlots January 1, 1961. This number was 2 percent above the 404,000 head on feed January 1, 1960 and was up seasonally by 13 percent from the 367,000 head on feed October 1, 1960. The January 1, 1961 number on feed was a record high for January 1. This reflected a continuation of the upward trend in cattle feeding of the last three years plus the usual seasonal uptrend for the winter feeding season. Supplies of grain were abundant at favorable prices to cattle feeders and fat cattle prices generally held up well during the fall of 1960.

Weight information for cattle and calves in feedlots January 1, 1961 revealed 25,000 head of heavy cattle (weighing over 1100 pounds) compared to 19,000 head January 1, 1960. In the 900 to 1100 pound group there were 129,000 head against 104,000 head a year earlier. Cattle and calves weighing less than 900 pounds totaled 260,000 head compared to 281,000 January 1, 1960.

Data on kinds of animals on feed in the state January 1, 1961 showed 199,000 steers and steer calves, 211,000 heifers and heifer calves, and 4,000 cows and others. On January 1 a year earlier there were 209,000 steers and steer calves, 191,000 heifers and heifer calves and 4,000 cows and others.

Reports from cattle feeders on length of time cattle had been in feedlots January 1, 1961 showed more animals on feed than a year earlier in both the "3 to 6 months" and "more than 6 months" categories but fewer animals than the previous year in the "less than 3 months" category. Feedlot inventories January 1, 1961 and January 1, 1960 were as follows: On feed less than 3 months—223,000 and 241,000 head; on feed 3 to 6 months—174,000 and 150,000 head; and on feed more than 6 months—17,000 and 13,000 head.

MILK COWS AND HEIFERS—Milk cow numbers continued downward in 1960 and on January 1, 1961 were at the lowest level in about 50 years. (Production of milk per cow, of course, was much higher.) **Cows and heifers** 2 years old and over kept for milk at 135,000 head on farms January 1, 1961 were 3 percent below the 139,000 head on hand a year earlier. The 10-year (1950-59) average inventory for January 1 was 169,000 head. Heifer calves for milk at 50,000 and milk heifers 1-2 years at 41,000 January 1, 1961 were both unchanged from January 1, 1960. Average value per head for milk cows was \$197.00 on January 1 against \$198.00 a year earlier.

CALF CROP—The 1960 Colorado calf crop totaled 801,000 head—up 3 percent from the 780,000 head born during 1959 and 4 percent above the 10-year average (1949-58) of 770,000 head.

An increase in the number of cows and heifers 2 years and older accounted for the larger 1960 calf crop. On January 1, 1960 there were 900,000 head of cows and heifers on Colorado farms and ranches in comparison with 886,000 a year earlier and the 10-year average of 880,000. Calves born during the year as a percentage of cows and heifers on hand the first of the year was 89 in 1960, 88 in 1959 and averaged 88 for the 1949-58 period.

Weather during the late winter and early spring of 1960 was quite stormy. Heavy snowfall and below normal temperatures from the first of the year to mid-March necessitated increased care during early calving. Most serious death losses of new calves occurred during late February in localized areas of southeastern Colorado. Weather for late calving was favorable. New growth of range and pasture grass was retarded in early spring by cool temperatures. Late spring and summer drought condition in much of the San Luis Valley and lower western valleys hindered grass development and resulted in relatively poor summer grazing. Summer grass was generally fair to good in eastern Colorado. Toward the end of August, lack of soil moisture throughout the state caused drying and early curing of grasses.

SHEEP AND LAMBS—Stock sheep were estimated at 1,434,000 head on January 1, 1961 the same as a year earlier and the largest January

inventory since 1946. This level is 13 percent above the 10-year (1950-59) average of 1,268,000 head. Favorable range feed conditions and large feed crops since 1956 have encouraged some restocking. Mature ewes numbered 1,188,000 head on January 1, 1961—a decrease of 1 percent from the inventory of 1,200,000 on hand January 1, 1960. Ewe lambs totaled 176,000 head on January 1, 1961, 177,000 a year earlier and 186,000 two years earlier. There were 540,000 sheep and lambs on feed for market on January 1, 1961 in addition to the above numbers of stock sheep. On January 1, 1960 there were 555,000 on feed. Average value per head for stock sheep January 1, 1961 was \$16.20 compared to \$18.50 January 1, 1960. Total value for all sheep on January 1, 1961 was \$31,331,000 and for January 1, 1960 was \$36,519,000.

Weather during late winter and early spring was quite stormy. Heavy snowfall and below normal temperatures made caring for sheep and lambs more difficult than usual. Heavy supplemental feeding was necessary throughout most of January, February and March. In latter February a severe cold wave accompanied by wind and drifting snow caused some shrink in most grazing areas. Early lambing losses were particularly heavy in some eastern and southern counties.

New growth of range and pasture grass was retarded in early spring by cool temperatures and dry topsoil condition. Continued drought conditions in much of the San Luis Valley and lower western valleys hindered grass development and resulted in relatively poor summer grazing. Late spring and early summer grazing was generally good on the high elevation sheep ranges. Toward the end of August a lack of soil moisture throughout the state caused drying and early curing of grasses in most sheep grazing areas.

SHEEP AND LAMBS ON FEED FOR MARKET—There were 540,000 head of sheep and lambs in Colorado on feed for market January 1, 1961, compared with 555,000 a year earlier and 540,000 head on feed January 1, 1959. This was about one-third the size of the sheep and lamb feeding operation in the years from 1924 to 1939 when numbers ranged from one million to one and one-half million head. The Colorado sheep and lamb feeding industry reached its peak January 1, 1930 with 2,035,000 head on feed. Although fewer lambs were on feed January 1, 1961 compared to a year earlier, Colorado lamb feeders retained their position as the leading lamb finishing state in the Nation.

Of the total number on feed January 1, 1961 reports from producers indicated that 16,000 head were sheep compared to 25,000 sheep on feed January 1, 1960. The decrease in the number on feed January 1961 compared with 1960 was almost entirely in northern Colorado. Sheep and lambs on feed in this area totaled 395,000 head which compared with 410,000 head a year earlier and 398,000 head two years earlier. In the Arkansas Valley the number on feed was 125,000 head, the same as on January 1, 1960. Data on weight of sheep and lambs on feed January 1, 1961 showed 5,000 under 60 pounds, 135,000 from 60 to 79 pounds, 325,000 from 80-99 pounds and 75,000 over 100 pounds. Weight data are not available for periods prior to November 1, 1960.

The in-movement to Northern Colorado in the fall of 1960 was a bit earlier than in the fall of 1959, while in-movement to the Arkansas Valley occurred at about the normal time. Feeder lamb prices were about \$2.00 less than the previous year and \$5.00 lower than in 1958. Favorable weather enabled feeders to put good gains on their lambs. Feed was in good supply with feed grain prices being slightly lower than in the fall of 1959 while hay prices were higher.

LAMB CROP—The 1960 lamb crop in Colorado amounted to 1,224,000 head, up 5 percent from the 1,166,000 in 1959 and 21 percent above the 1949-58 average of 1,009,000 head. The 1960 lamb crop was at the highest level since 1943 and was the third consecutive year of increase from the recent low which occurred in 1957.

The 1960 lamb crop percentage (number of lambs saved per 100 ewes one year of age or over on farms and ranches January 1) was 102, equal to the 1959 lambing percentage and 6 points above average. The number of ewes one year old and over on farms January 1, 1960 at 1,200,000 was 5 percent above the 1,143,000 head January 1, 1959. This larger number of breeding ewes on hand January 1, 1960 was responsible for the increased lamb crop.

WOOL—Wool production in Colorado during 1960 was 14,808,000 pounds. This was 9 percent above 1959 production of 13,589,000 pounds and 29 percent above the 1949-58 average of 11,512,000 pounds. Colorado's 1960 wool clip was the state's largest since 1943 when a record high of 15,458,000 pounds was produced.

Sheep and lambs shorn (including feedlot lambs) in 1960 totaled 1,625,000 head in comparison with 1,457,000 head in 1959 and the 10-year average of 1,251,000. Average fleece weight was 9.1 pounds in 1960 and 9.3 pounds in 1959.

Value of the 1960 wool crop was \$6,367,000 based on the average price of 43 cents a pound received for wool sold, April 1960 through January 1961. The 1959 wool crop also averaged 43 cents a pound and had a total valuation of \$5,843,000. The total valuation for the 1949-58 period averaged \$6,172,000. Government wool incentive payments are not included in above price and valuation figures.

HOGS AND PIGS—Hogs on farms January 1, 1961 were estimated at 193,000 head. This was 12 percent below the 219,000 head on hand January 1, 1960. The 1961 numbers were above the level for the 1953 through 1959 period but were at a relatively low level and were less than one-fourth of the 1944 peak of 774,000 hogs. Average values were up from \$16.30 per head on January 1, 1960 to \$21.80 for January 1, 1961.

PIG CROP—Colorado's 1960 pig crop totaled 292,000 head. This compared to the 1959 pig crop of 347,000 head and the 1949-58 average of 318,000 head. Colorado hog production reached its peak in 1943 when 961,000 head were saved. Litter average in 1943 was 5.9 pigs per sow compared to the litter average of 6.8 pigs saved per sow in 1960. The 1949-58 average was 6.5 pigs saved per litter.

A little more than half of the total 1960 pig crop, or 147,000 head, was accounted for by the fall pig crop. There were 22,000 fall sows farrowed, 1,000 more than intentions in June, 1960. This was 8 percent below the 24,000 fall sows farrowed in 1959, but 5 percent above the 10-year average of 21,000 head of fall sows farrowed. Pigs saved per fall litter averaged 6.7 head in 1960. This was slightly below the 6.9 pigs saved per litter in 1959. The 1949-58 average was 6.6 pigs per fall litter. Pigs saved from spring litters were at a record high of 6.9 pigs saved per litter.

Fall farrowings were spread more evenly between months in 1960 than in 1959 although they still peaked in September. Monthly distribution was as follows: June, 16.3 percent; July, 15.0 percent; August, 20.1 percent; September 23.0 percent; October, 17.1 percent and November, 8.5 percent.

CHICKENS AND EGGS—Chicken on farms January 1, 1961, totaled 1,468,000 birds—247,000 less than the preceding year, continuing the downward trend from 1944 when chickens on farms reached a peak of 5,254,000 birds. The number on farms January 1, 1961 was the lowest on record. The value per bird on January 1, 1961 was \$1.05—11 cents above January 1, 1960 and the same as the four years preceding 1960. The total valuation of \$1,541,000 was the lowest since the January 1, 1935 valuation of \$1,481,000.

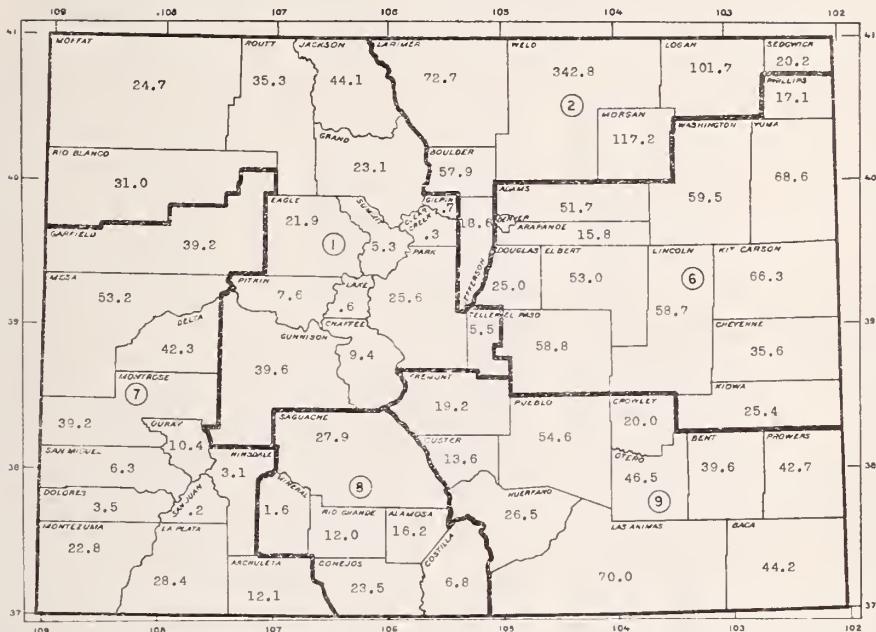

The average number of layers on hand during 1960 was the lowest on record at 1,386,000 birds. This was 147,000 birds below the 1959 number and continued the decline from the 1944 peak when 3,622,000 layers were on farms. The number of eggs per layer averaged 199 during 1960, up from 196 eggs per layer in 1959.

Annual production of eggs totaled 276 million in 1960 compared to 301 million produced in 1959. This was the lowest egg production on record dating back to 1925 when 327 million eggs were produced.

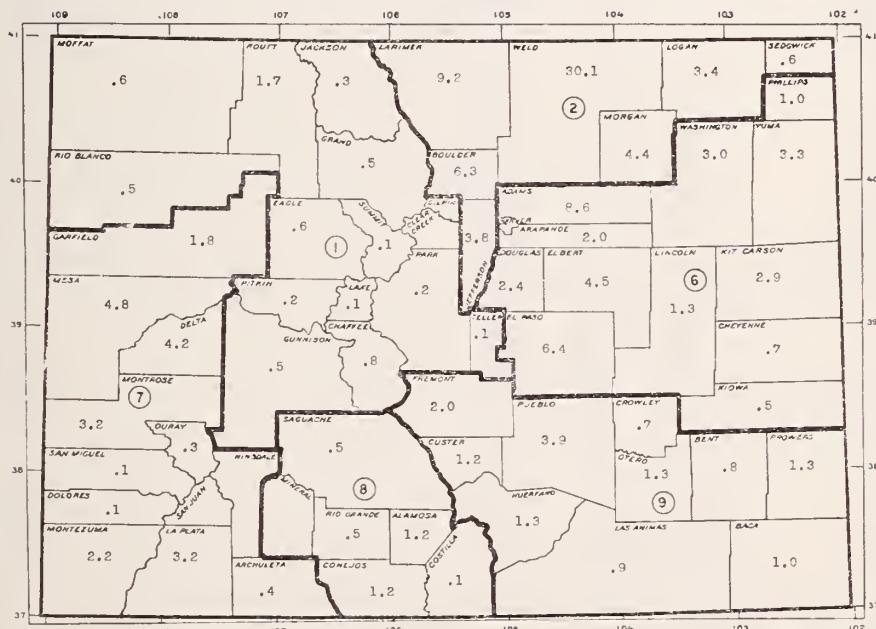

TURKEYS—Turkey growers in Colorado raised 1,543,000 birds in 1960. This was an increase of 20 percent over the 1959 crop of 1,286,000 birds and the largest crop on record. The 1949-58 average was 899,400 birds.

The January 1, 1961 inventory of turkeys was 42,000 birds, an increase of 12,000 birds from January 1, 1960. The value per bird increased to \$5.00 on January 1, 1961 from \$4.50 on January 1, 1960. The total valuation of turkeys on hand was \$210,000 for January 1, 1961 compared to \$135,000 the preceding year, an increase of 56 percent. Turkey breeder hens on hand January 1, 1961 numbered 15,000, the highest since 1950 when 17,000 birds were on hand for breeding purposes. The January 1, 1960 number was 11,000 birds.

¹Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

²Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

³Value of combined sales plus value of products consumed in the farm household.

MILK—PRODUCTION OF MILK ON FARMS, 1950-1959

Year	Number of Milk Cows on Farms ¹ Thousands	Production Per Milk Cow ²		Percentage of Butterfat in Milk Percent	Total Production on Farms		Butter Churned on Farms

GULDAG & STATISTICS 1959-68 8

LAND CLASSIFICATION
OF COLORADO

Land Use Category	Percentage of Total Land Area
Irrigated land	10%
First class dry farming	15%
Second class dry farming	25%
Third class dry farming	20%
Sand hills	10%
National forests	10%
National parks	5%
Grazing land	10%
Forage crop land	10%

U. S. DEPARTMENT OF AGRICULTURE

NEG. 32989

WHY CROP AND LIVESTOCK REPORTS

• • •

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
