CROP AND LIVESTOCK INDEXES

Indexes are used to combine the various Crop and Livestock items into a total to show yearly changes in gross production of crops and livestock. The procedure used in preparing the following production indexes for Colorado involves multiplying the average price of each commodity during the base period (1957-1959) by the quantity produced each year to obtain quantity price aggregates, for groups or sub-groups of commodities. Quantity price aggregates each year are divided by the average quantity price aggregate during the base period and multiplied by 100 to obtain the index.

The **index of livestock and poultry on farms** measures year to year changes in livestock inventory. It was prepared by use of the relative values of different species of livestock. The greater the index number the more livestock on hand January 1 of each year. The meat animal inventory index includes milk cattle since most of these are finally included in meat production. However, this is not duplicated in the all livestock inventory index. See page 69 for the tables of index numbers.

The **index of production of livestock and livestock products** measures the gross volume of livestock and livestock products, other than horses and mules produced during the year. This index has shown a steady increase in production since 1957, primarily because of an increase in the production of meat animals in the state.

The **index of crop production** measures the gross volume of crops produced during the year regardless of eventual disposition or use. This index includes all crops of importance in Colorado. Food grains and feed grains are the primary components of the series and have a marked effect on the over-all crop index.

CROP AND LIVESTOCK PRODUCTION, COLORADO, 1932-1965
Index Numbers (1957-1959 = 100)

1965 CROP REVIEW

The 1965 crop season started off on an extremely dismal note. Drought, which had persisted for three years over most of the State and for the fourth year in the Southeast, continued to intensify. Winter grains were seeded in dry seedbeds, and germination was inadequate in many localities. Dry conditions prevailed throughout the fall and winter months, and very little vegetative growth was obtained before spring. On the Western Slope, moisture supplies were much better, and winter grains made a good start.

Moisture shortages continued through the spring, and the small grain picture on the Eastern Slope became more serious. Winds and dust storms caused extensive abandonment of small grains, and much of the acreage literally ran out of moisture.

Drought conditions, which had become so severe, were finally broken mid-way through the 1965 season. Heavy rains in June caused widespread flooding, and considerable crop losses along streams and rivers on the Eastern Slope. However, as far as crop production is concerned, benefits from the water more than offset these losses. Summer crops made excellent response to the improved moisture conditions. Favorable moisture prevailed through the remainder of the season, and generally late crops made very fine yields. Cool summer temperatures prevented many warm season crops from reaching maximum potentials as might be expected under the unusually favorable moisture conditions.

Irrigation water supplies were much better than they had been in several years. Snowpack in the mountains was deeper than usual, and mid-summer floods added to the snow run-off.

Colorado farmers devoted a total of 7,383,000 acres to crop production during 1965. This was 6 percent more than the 6,990,000 acres utilized in 1964. This figure includes planted acres for all crops except for hay which is harvested acres. There is some duplication of acreage because of the large amount of winter wheat which was abandoned but re-seeded to other crops. Harvested acreage for all crops in 1965 totaled 5,354,000 acres, practically the same as the 5,347,000 acres harvested in 1964.

Generally, yields from crops in 1965 were better than the 1964 returns. Record-high yields per acre were shown for barley, corn, and sorghums. Spring wheat, oats, and sugar beets were the only crops showing declines in yields from the previous year. An all-time record-high hay crop was produced in 1965 and the sorghum grain crop was the second largest ever produced in Colorado.

An early fall freeze threatened many crops, but losses were held to a minimum. Some corn acreage for grain had to be harvested for silage, and a few late fields of grain sorghum, dry beans, and hay were nipped.

Total value of all crops produced during 1965 in Colorado is estimated at \$261,000,000. This is just above the \$260,000,000 value for 1964 production. The index of all production amounted to 83 percent of the 1957-59 base compared with 80 percent for 1964. The index for food grain at 40 percent is considerably lower than in 1964 when it amounted to 52 percent. Feed grains were up, however, to 87 percent compared with only 65 percent the previous year.

Pasture and ranges during the first half of the season were quite poor because of the lack of moisture. This was not true on the Western Slope, however, where moisture was sufficient to make for favorable grazing throughout the season. Mid-summer rains improved grazing sharply, and late season grazing was excellent in all areas.

WHEAT—Colorado's 1965 winter wheat crop bore the brunt of the severe drought conditions. Production totaled only 19,948,000 bushels, 24 percent less than the drought-ridden 1964 crop of 26,257,000 bushels. This crop was the smallest produced since 1956 and amounted to only 43 percent of the 1959-63 average of 46,782,000 bushels. Drought was primarily responsible for widespread abandonment of the 1965 crop. Only 1,287,000 acres were harvested out of 2,954,000 planted acres. It is only 59 percent of the 1959-63 average of 2,182,000 acres harvested. An average return per acre of 15.5 bushels was realized, which is the same as for 1964 but 5.3 bushels less than the 5-year average. A severe shortage of moisture, which was intensified by high winds and dust storms, was the primary reason for the disastrous crop. Hail storms and heavy rust damage in the Northeast were also factors contributing to the small crop.

BARLEY AND OATS—Barley production during 1965 totaled 10,626,000 bushels. This is 17 percent more than the 9,060,000-bushel output in 1964, but is 27 percent less than the 5-year average. A total of 269,000 acres were harvested, which was 11 percent less than in 1964. However, a record-high return per acre of 39.5 bushels exceeded the previous high in 1961 by 6 bushels. This excellent return more than offset the 11 percent decline in acres harvested from 1964. An increase in the proportion of the total acreage that was irrigated was primarily responsible for the record yield. Irrigated acreage yielded a record high of 50.7 bushels, and dryland acreage produced a 23.0-bushel average. Drought conditions during the fall discouraged farmers from planting winter barley; thus plantings were the smallest in many years. Oat production in 1965 amounted to 4,294,000 bushels. This is 39 percent more than the 3,081,000-bushel 1964 crop. The crop was produced from 113,000 harvested acres which averaged 38.0 bushels per acre. This compares with 78,000 acres harvested in 1964, which averaged 39.5 bushels per acre.

SUGAR BEETS—Sugar beets failed to size out as well as expected because of below-seasonal temperatures. Production of 2,101,000 tons fell 25 percent short of the 1964 output of 2,783,000 tons. Several factors accounted for this drop in production. Sugar beet allotments were cut sharply from 1964. Abandonment was much heavier, and average yield was below the previous year. The average yield of 15.3 tons per acre was the smallest since 1961 and compares with the 15.7 ton return in 1964. The 5-year average was 16.7 tons. Harvested acreage totaled 137,300, the smallest since 1957.

DRY BEANS—Dry bean production in Colorado during 1965 amounted to 1,883,000 bags (100-pounds clean basis). This is 22 percent greater than the 1964 output of 1,547,000 bags, but still 1 percent less than the 5-year average of 1,897,000 bags. A 10,000-acre increase over 1964 in acres harvested was shown with 219,000 acres threshed compared with 223,000 acres for the 5-year average. An average return per acre of 860 pounds was bagged. This is 120 pounds more than the 740-pound yield in 1964, but just above the 850-pound 5-year average. Crop returns were better than most growers had anticipated. Freezing temperatures in mid-September caused some damage in various localities, but quality rather than quantity suffered most. General precipitation over the Western Slope caused some discoloration of beans and delayed harvest operations. Cool temperatures, killing frosts, and wet weather reduced the quality of the crop on the Western Slope.

CORN—Corn for grain produced a record-high yield of 70.0 bushels per acre. This was far better than the 5-year average of 56.8 bushels and exceeds the 1964 yield by 5 bushels. Production totaled 14,070,000 bushels, surpassing the 1964 crop by 14 percent and the 5-year average by 7 percent. Acres harvested for grain at 201,000 acres was 6 percent more than the previous year. An early freeze in the Northeast and on the Western Slope caused some grain acreage to be used for silage. Irrigated acreage produced an average of 78.0 bushels and dryland yielded 20.0 bushels per acre compared with 76.8 and 16.0 the previous year. Ample irrigation water was available throughout the period, but cool temperatures prevented the crop from reaching maximum potentials.

SORGHUM—Late season rains were quite beneficial to the 1965 sorghum grain crop. Production of grain totaled 13,064,000 bushels, the second highest of record and nearly twice the 1964 crop of 6,738,000 bushels. A record-high yield per acre of 35.5 bushels per acre was harvested from 368,000 acres. The previous record-high was 34.0 bushels in 1962. Dryland acreage produced a fine 21.0 bushel yield, and irrigated acreage averaged 60.0 bushels.

BROOMCORN—Broomcorn production in 1965 totaled 10,500 tons. This is more than double the previous year's output of 5,200 tons and 41 percent larger than the 5-year average of 7,460 tons. It was also the largest crop since 1957 when 11,200 tons were produced. The crop was harvested from 70,000 acres which is 21 percent more than a year ago. Yield per acre averaged 300 pounds, far exceeding the 180-pound yield in 1964.

HAY—Colorado farmers produced an all-time record-high hay crop for 1965. Production totaled 3,661,000 tons exceeding the previous high of 3,124,000 tons in 1920. Also, it was 30 percent more than the 2,827,000-ton output produced in 1964. A fine average yield of 1.85 tons per acre was not far below the record high of 1.90 set in 1957. A total of 1,980,000 acres was harvested, which exceeds the previous year by 17 percent and the 5-year average by 27 percent. A substantial part of this increase resulted from larger than usual acreages of millet, Sudan, and sorghum-Sudan hybrids. Much of these crops were seeded on abandoned winter wheat acreage. Production of the major hay crop, alfalfa, amounted to 2,217,000 tons, also a record high.

POTATOES—Production of fall potatoes in the San Luis Valley totaled 8,575,000 cwt., 30 percent more than the short crop of 1964. Yields averaged 245 cwt. per acre from 35,000 acres harvested. This was 6 percent more acreage than the previous year and a 45 cwt. per acre higher yield. Late summer production in other regions of the State amounted to 2,496,000 cwt., 5 percent more than the 2,379,000 cwt. for 1964. The crop was harvested from 12,800 acres compared with 12,200 acres the previous year. Yields averaged 195 cwt. per acre, the same as in 1964.

MILLET—Production of millet grain including proso (hershey) was estimated for the first time in 1965. The crop was placed at 2,415,000 cwt. This was an exceptional year for millet production, primarily because of the widespread abandonment of winter wheat. Also late season moisture was quite favorable for the crop. Average yield of 11.5 cwt. was estimated. Most of this grain is proso millet and is produced in the east central part of the State, including Phillips, Washington, and Yuma Counties.

ALFALFA SEED—Colorado's 1965 alfalfa seed crop was the smallest produced since 1941. Only 1,080,000 pounds were harvested, less than half the 2,250,000 pound crop for 1964. Heavy rains reduced seed production and acreage also dropped off sharply. Only 9,000 acres were threshed, compared with 15,000 the previous year.

¹Estimates for late summer and fall potatoes prior to 1959 are not comparable with those after 1959 due to a change in area designation of seasonal groups.

²Production and quantity sold figures are included in All Potatoes.

³Total stocks consist of "production less total disappearance to date." Disappearance includes all sales for all purposes to date, all potatoes eaten or fed on farms where produced to date and all losses to date through shrinkage, decay, dumping, etc.

⁴Preliminary.

COLORADO WHEAT VARIETIES

Wheat variety surveys in Colorado have normally been conducted in the fall of the year. The 1966 crop was surveyed in the spring and marked the first time that there was a survey in three successive years. This survey was conducted only at 5-year intervals prior to 1965.

Wichita continues to lead all winter wheat varieties seeded in Colorado. However, its popularity has declined for the third consecutive year. This was the first survey since 1954 that shows Wichita accounting for less than half of the winter wheat sown in the State. It comprised 49.3 percent which was almost exactly double the second ranking variety. Wichita declined from the preceding year in all parts of Colorado except the Southwest. Acreage seeded to this variety was down most sharply in the Northeast.

Wichita has been the most popular winter wheat variety in Colorado since 1954. It reached a peak in the 1959 survey and has been generally declining since then. However, no other variety has come close to supplanting Wichita in the past ten years.

Warrior has been the second most popular variety since it first appeared on the 1964 survey. It gained in popularity from 1964 to 1965 but declined, along with Wichita, for the 1966 crop. Warrior was seeded on 24.7 percent of the State's winter wheat acreage, down 2 points from the preceding year. Warrior declined in importance in every district of the State from 1965 to 1966 except the Northwest where it never has been very important.

Scout showed a tremendous jump from less than 1 percent of the seeded winter wheat acreage in 1965 to 5.3 percent in 1966. This increase placed Scout third in Colorado. It is grown in most wheat areas of the State with the greatest acreage appearing in the Northeast counties. Scout was released in 1965. It is early maturing, rust resistant, strong standing and is good for milling and baking.

Other important varieties in Colorado in 1966 included Comanche and Cheyenne. Both of these varieties have been long time favorites in this State. However, they have gradually been supplanted by newer varieties and declined in importance in recent years. Kaw, Bison and Itana complete the top eight varieties in Colorado. Kaw and Bison are most popular in the Southeastern district. Itana is grown almost exclusively in Northwestern Colorado where it has been getting steadily more important.

The 1965 survey also obtained yield information by varieties. Itana showed the highest yield with most of the acreage grown on the Western Slope which had a much better season than the rest of the State in that year. Wichita and Warrior were the top yielders with major acreages. Comanche, the old standby, was again one of the better producers. Cheyenne appeared to suffer a little more from drought than it did in 1964. Yields for different varieties should not be compared between areas because of the extreme variation in growing conditions during 1965.

FRUITS & VEGETABLES

1965 Season

FRUIT CROPS—Favorable growing and sizing weather during most of the season enabled the main fruit areas of the Western Slope to produce excellent quality fruit in 1965. Many trees in Mesa County that received freeze damage in 1963 began producing a near-average fruit crop again. Hail damaged a portion of the peach crop in Mesa County and most of the sour cherry crop in Larimer County. Weather at harvest time was generally ideal for all crops except sweet cherries. Pickers and shed personnel of sufficient number were available for harvest of each crop, except in some late apple orchards. Supplies of irrigation water were adequate throughout the State. Production, unit value and total 1964 and 1965 farm value of each fruit crop are shown in tables for this section.

Peach production in 1965 totaled 1,150,000 bushels or slightly below the 1,200,000 bushels produced in 1964. This year's crop was of higher quality and better size than in other recent years. Harvest of the July Elbertas and Redhavens was completed during late July and early August. The main peach harvest on the Standard Elberta variety was completed by mid-September in Mesa and late September in Delta County. This was about two weeks later than normal. However, this slow harvest enabled growers to have an ample number of pickers available. Cold weather late in the season caused fruit damage and loss in some Delta County orchards.

Pear production at 240,000 bushels was considerably above the 1964 production of 200,000 bushels. Part of this increase may be attributed to new trees planted during recent years that are now beginning to bear in many orchards. A part of the Mesa and Delta County crop was purchased for processing which initiated some earlier harvesting than during recent years. Harvest was generally completed by September 1.

Apple growers in Colorado produced 1,600,000 bushels in 1965 or a crop equal in size with a year earlier. Harvest of early varieties was completed by mid-September. In Delta County, the late season's cool, wet weather delayed the main harvest of late varieties until after October 1, which was about one week behind picking progress in 1964. The crop quality was excellent despite the slow sizing.

Sweet and sour cherry growers produced above average crops in 1965. Sweet cherry production at 1,100 tons equaled the 1964 crop. Quality and size of this year's crop were superior to that of recent years. Frequent rains prior to harvest caused some harvesting problems in many Delta and Garfield County orchards. Sour cherry production at 1,700 tons may be compared with the 1964 crop of 1,600 tons. Western Slope growers produced their largest crop in a number of years.

COMMERCIAL VEGETABLES—Commercial vegetable production is an important element in the agricultural economy of Colorado. In 1965 the value of all vegetables grown reached \$18,533,000 and accounted for approximately 7 percent of the State's total crop value. Colorado growers produce vegetables for both fresh market and processing use. Fresh market production, as in previous years, dominated the total farm value derived from vegetable production in 1965, accounting for nearly 93 percent of the total. In the 1965 National picture, Colorado ranked 15th in acreage harvested, 9th in total production and 8th in value of commercial fresh market vegetables grown.

Vegetable growers in all parts of Colorado rely completely on irrigation throughout the growing season. This, in part, accounts for the State's

vegetable yields being consistently higher than the National average on most crops. The dry climate also provides growers with good growing and harvesting weather. Modern farming practices, including use of the newest seed technology and machinery, provide additional aid to Colorado farmers in obtaining a high level of production.

Heavy mountain snows during the 1964-65 winter season and numerous spring rains provided an excellent supply of irrigation water for the entire season in each of the main vegetable producing areas. The above-normal snowpack and spring runoff replenished many storage reservoirs which had reached record-low levels in some localities. While the early season rains and runoff were beneficial in rebuilding water supplies, they also caused some severe flooding during mid-June. Many growers with fields located near rivers or creeks received excessive damage to early plantings, causing more abandonment than has been common during recent years. Heaviest losses were incurred in Northern Colorado and the Arkansas Valley.

The 1965 growing season was late in starting and cool weather in late May slowed early crop development. Frequent rains during June and July caused many pre-harvest problems to growers. Hail damage was spotty, but severe in localized areas of Northern Colorado and the San Luis Valley. Crop losses were heaviest on onions and cabbage. Wet weather during the main harvesting periods resulted in some additional crop losses from internal rot in onions, slime on lettuce and spoilage on tomatoes and cantaloups. Labor supplies for pre-harvest and harvest operations were generally adequate, although qualified labor was considered in short supply by the State's vegetable growers and handlers.

Colorado farmers raise a wide variety of commercial vegetables in various parts of the State. Each of the main vegetable producing areas have a few crops that usually account for most of the areas' total farm value derived from vegetables. During 1965, the leading crops in each were: Northern Colorado—onions, carrots, sweet corn, cabbage; San Luis Valley—lettuce, spinach, carrots; Arkansas Valley—onions, cantaloups, tomatoes; Western Slope—onions and tomatoes. Complete information on all important vegetables grown in the State can be obtained from the table for this section.

FARM INCOME AND PRICES

Farming income in Colorado during 1964 totaled \$711,500,000, 1 percent less than in 1963. This was the second consecutive year that total farm income declined. The decline was largely attributable to the drought's effect on crops and low livestock prices. Income from the marketing of livestock and livestock products in 1964 amounted to \$462,915,000, down less than 1 percent from a year earlier. Crop marketings totaled \$190,730,000 in 1964. This was down \$15.2 million from 1963, a drop of 7 percent. Government payments brought \$57.8 million, an increase of \$14.5 million over 1963.

In 1965 the preliminary total income for Colorado was estimated at \$787,600,000. This was 11 percent higher than 1964 and an all-time record for the State. Income from farm marketings, at \$727,100,000, was also 11 percent above the previous year. Sales of livestock and livestock products provided 73 percent of the total income from farm marketings. Livestock sales amounted to \$533,800,000, a 15 percent increase over 1964. Colorado ranked 14th among the States in income from livestock. Marketing of crops provided an income of \$193,354,000 for Colorado farmers. Government payments totaled \$60.5 million, an increase of \$2.6 million over the preceding year.

Prices received for livestock sold in 1965 were generally higher than in 1964. The sharpest increase recorded was for hogs. They brought an average of \$21.40 per hundredweight in 1965 compared with \$15.20 the previous year. The 1965 price was the highest Colorado farmers had received for hogs since 1954. The beef cattle price in 1965 was \$23.30 per hundredweight. This was almost \$3.00 over the preceding year and the highest annual average since 1959. Changes in crop prices were mixed between 1964 and 1965. The winter wheat price was unchanged at \$1.31 per bushel. Potato prices dropped sharply in 1965 to \$1.79 per hundredweight from the 1964 price of \$3.33. The 1965 dry bean price was \$8.10 per hundredweight which was up \$.40 from 1964 and the highest on record since 1952.

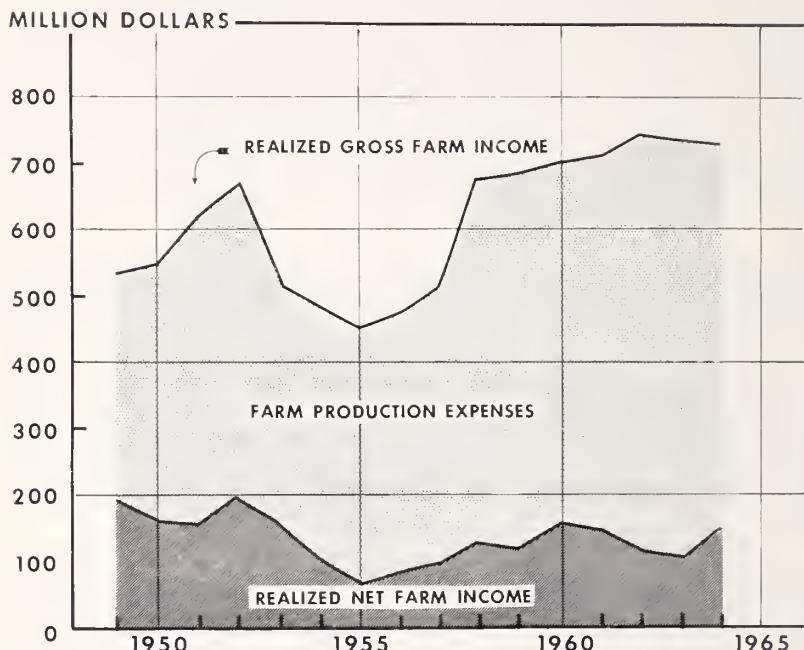

Prices received by farmers for their livestock and livestock products were generally lower in 1964 than in 1963. Exceptions were sheep and lambs, wholesale milk, eggs and honey products. Farmers received a higher average price for most crops in 1964.

¹Data are taken from the "Survey of Current Business" published by the U.S. Dept. of Commerce, under the heading "Personal Income by States and Regions." For detailed explanation of these estimates, see text in July, 1965 Issue "Survey of Current Business."

²Compiled from Mineral Industry Surveys of the U.S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

³In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not included for security reasons.

⁴Unavailable.

⁵Preliminary.

⁶Unallocated—to avoid disclosing individual operations.

LIVESTOCK INVENTORY AND VALUE

The year 1965 was favorable for the Colorado livestock industry in many respects. Production of feed grains and roughages was substantially higher than the previous year. Prices received by farmers and ranchers for most classes of livestock were the highest in recent years. Beef cattle prices averaged the highest since 1959. Lambs brought the highest average price since 1951, while hogs were the highest since 1954. This occurred despite an increase of nearly 2 percent in the production of meat animals compared with 1964. Farm production of meat animals in Colorado during 1965 totaled 1,258 million pounds. Cash receipts from the sale of meat animals amounted to \$471.6 million, 19 percent more than the previous year. At the end of the year the number of all cattle and calves on farms as well as cattle on feed were at record high levels. Also, the number of sheep and lambs on feed was the highest for the date since 1962.

The index of livestock and poultry numbers on January 1, 1966 was 12 points above a year earlier at 136 percent of the 1957-1959 base period. Index figures are a measure of the overall change in livestock inventory. The meat animal index made up the bulk of the all-livestock index and at 136 was also 12 points above a year earlier. The poultry index, composed of turkey and chicken numbers, was 85 percent of the base period on January 1, 1966. This was a decline of 1 point from a year earlier.

Those items which have considerable weight in the index showed increased numbers compared with a year earlier. Cattle and calves, sheep and lambs, and turkeys were up substantially from January 1, 1965. Milk cows, hogs, and chickens were lower. The value of livestock and poultry on farms as of January 1 was \$424.3 million, 33 percent above the preceding year. Colorado continued to be the top-ranked State in the number of sheep on feed and was 7th in stock sheep and lambs on farms. Colorado gained one place in number of all cattle and calves, ranking 12th in that category and 11th in beef cows 2 years and older. Colorado ranked 27th in the Nation in hog numbers and 33rd in milk cows 2 years old or older. The State ranked 23rd in turkey numbers and was 39th in chicken numbers.

The 1965 grazing period started out very well on the Western Slope and ranges there continued to provide excellent grazing throughout the season. Livestock were generally in good condition when moved to lower elevations in the fall. In contrast to western areas, Eastern Slope ranges and pastures provided very little new feed until almost mid-year because of the drought which carried over from 1964. However, after mid-May rainfall on the Eastern Plains was abundant and grasses provided a good supply of feed the remainder of the season. Growth of fall-seeded wheat in 1965 was the best of recent years and supported grazing in very good fashion until late in the year. The year 1965 saw a record crop of hay harvested in the State, and feed grain production showed substantial increases over the previous year. Livestock went into the winter feeding season in good to excellent condition with supplies of feed and roughage sufficient to maintain them with little difficulty.

ALL CATTLE AND CALVES—The number of cattle and calves in Colorado on January 1, 1966 was 2,869,000 head—an increase of 10 percent over a year earlier. This was 18 percent above the 5-year (1960-64) average of 2,430,000 head. An increase in basic breeding herds accounted for part of the increase in the total number of cattle. Beef cow numbers on January 1 were estimated at 914,000 head, 3,000 head more than on January 1, 1965. Beef heifers at 450,000 head were 22 percent above the 370,000 on hand a year earlier. Beef calves numbered 810,000 head for an

increase of 15 percent. Total value of all cattle and calves on farms at the beginning of 1966 was \$376 million compared with \$283 million a year earlier. This increase in inventory resulted from both a higher total inventory and an increase in value per head of all livestock species. The value per head for cattle was \$131 at the beginning of 1966 compared with \$109 per head the preceding January.

DAIRY CATTLE—The January 1, 1966 inventory of cows and heifers 2 years old and older kept for milk totaled 112,000 head, continuing the long time downward trend. A year earlier there were 118,000 head on hand. The average number of milk cows on farms in Colorado during 1965 was 106,000 head, 2 percent below the 1964 average of 108,000 head.

Milk production per cow in 1965 set a new record high, averaging 7,800 pounds. Production per cow has shown an increase each year since 1947. However, the increase from 1964 to 1965 was the smallest in that 18-year period. There were 827 million pounds of milk produced in 1965, 12 million pounds less than 1964 and the greatest annual drop in production since 1961.

FEEDLOT CATTLE—The beginning of 1966 saw 596,000 head of cattle and calves in Colorado feedlots. This was an increase of 12 percent over the January 1, 1965 number. The number of cattle in feedlots is included in the January 1 total inventory of cattle and calves. There were 79 feedlots with 1,000 head or more capacity on January 1 compared with 83 a year earlier. Twenty-nine of these lots had a capacity of 5,000 head or more and held 299,000 head at the first of the year. Feedlots with capacities of 500-999 head numbered 114 compared with 104 a year earlier and contained 63,000 head, 12 percent above January 1, 1965. The smaller lots of less than 500-head capacity numbered 1,126 and contained 142,000 cattle.

Early in 1966, area estimates of cattle on feed were shifted to the crop reporting district basis with the Western Slope comprising a single area. The bulk of cattle on feed January 1, 1966 were being fed in the Northeast with 74 percent of the State total. A year earlier, this area fed 72 percent of the total. The East Central district accounted for 14 percent of the total number on feed, no change from a year earlier. The Southeast district in which the Arkansas Valley is located had 10 percent of the State total, a decline of 2 points from January 1, 1965. Total marketings of fat cattle in the state during 1965 amounted to 1,144,000 head, an increase of 20 percent over 1964.

CALF CROP—The number of calves born in the State during 1965 was a record high. A total of 926,000 calves were born during the year, 1 percent more than in 1964. In general, the 1965 spring calving was somewhat hampered by cold weather but losses were not heavier than usual. Cows went into the calving season in poorer condition than in 1964 because of a shortage of grazing and supplemental feed.

SHEEP AND LAMBS—The January 1, 1966 sheep and lamb inventory at 1,678,000 head was 10 percent above a year earlier. This was the first increase seen in sheep numbers since the decline began in 1961. Ewes at 941,000 head showed a 2 percent increase over a year earlier. Ewe lambs were also 2 percent above January 1, 1965 at 119,000 head.

There were 934,000 lambs saved in Colorado during 1965. This was 5 percent less than the 983,000 crop of 1964 and 21 percent less than the 5-year average lamb crop of 1,176,000 head. The 1965 lamb crop was the smallest since 1927, continuing the decline which began in 1963. Condition of breeding stock during the lambing season of 1965 was 2 to 3 points below the previous year. This was mainly because of the drought which made range feed conditions poor throughout much of the Eastern Slope

during the spring of the year. Cold, rainy weather on the Western Slope added to lambing problems in that area. Predators continued to be a major source of concern to sheep producers.

SHEEP AND LAMBS ON FEED—As of March 1, 1965 there were 290,000 sheep and lambs on feed, the lowest number for the date in recent years. Placements of lambs on feed were below normal throughout the 1964-65 feeding season. By November 1, 1965 there were 548,000 head on feed for the slaughter market in Colorado. This was an increase of 2 percent over a year earlier. Lambs were generally placed on feed somewhat later than in 1964 when placements were early because of dry range conditions in the New Mexico and Wyoming sheep-producing areas. Also, the supply of pasture feed on volunteer wheat acreage in western Kansas in the fall of 1965 was greater than any of the previous four years. This delayed movement to Colorado feedlots. Lambs on feed were heavier than a year earlier, indicating they came off the ranges in better condition than in 1964. Sugar beet harvest was later than usual which delayed many feeders in moving lambs to beet tops.

On January 1, 1966 there were 551,000 lambs and sheep on feed in Colorado, an increase of 28 percent over the 430,000 on feed a year earlier. This was the largest number on feed for the date since 1962. Placements during November and December amounted to 170,000 head compared with 62,000 head during the same period in 1964. The increase in placements over the corresponding period a year earlier resulted from the excellent wheat pasture, feed grain and hay situation and favorable prices for slaughter lambs. Marketings during the 2-month period, however, were 2 percent below the same period in 1964.

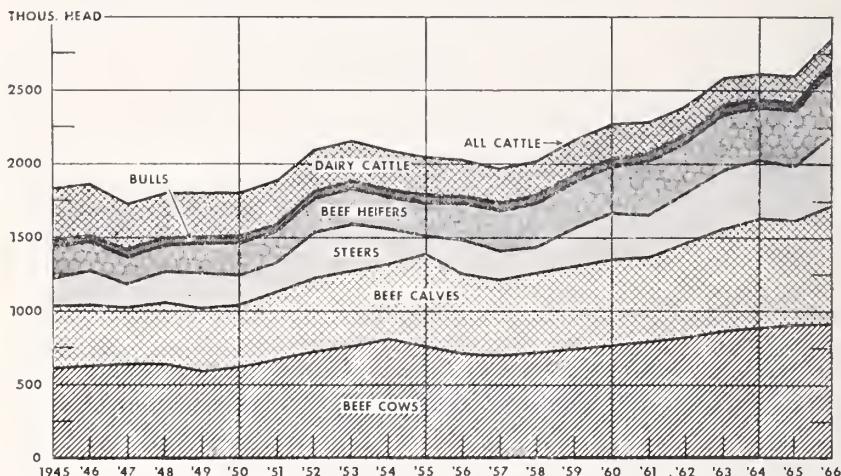

WOOL PRODUCTION—A decline both in the number of sheep and lambs shorn and fleece weight for 1965 lowered wool production by 10 percent from 1964. Production of wool totaled 11,410,000 pounds in 1965, while fleece weight averaged 9.1 pounds compared with 9.6 pounds for 1964. Wool production and number of sheep shorn in 1965 were the lowest since 1957. Fleece weight was the lowest since 1962. The average price farmers received for wool (excluding incentive payments) was 46 cents per pound, down 4 cents from 1964. Total value of 1965 wool production was \$5,249,000.

HOGS AND PIGS—The all hog inventory on January 1, 1966 was 213,000 head, 5 percent less than a year earlier. Total value of the inventory was up substantially over January 1, 1965 because of an increase in per head value to \$39.40 compared with only \$22.60 a year earlier. On December 1, 1965, hogs and pigs on Colorado farms and ranches totaled 223,000 head, 7 percent below the same date in 1964. Breeding hogs numbered 36,000 head, an increase of 2,000 head over a year earlier. The 1965 spring pig crop at 161,000 head was 11 percent lower than the State's spring crop of 1964. Sows farrowed totaled 23,000 head compared with 25,000 head during the spring of 1964. The 1965 fall pig crop amounted to 151,000 head, 1 percent below fall farrowings in 1964. The crop was produced from 21,000 sows, 1,000 head less than were farrowed a year earlier.

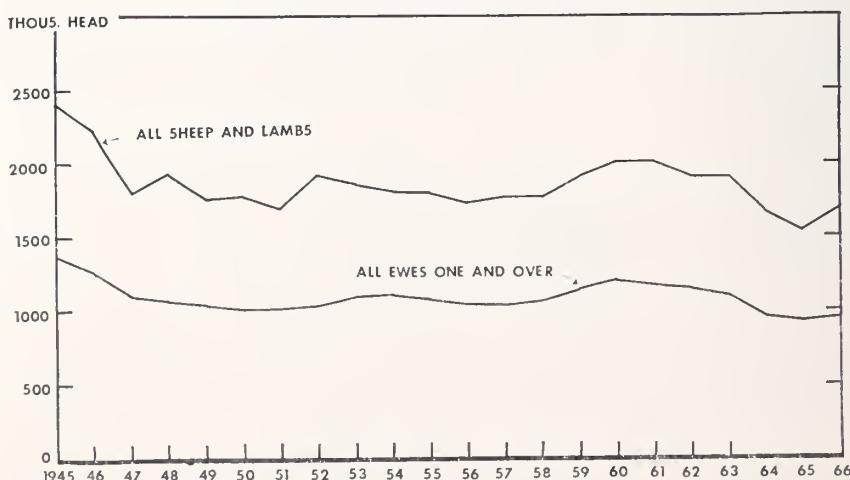

CHICKENS AND EGGS—All chickens on farms January 1, 1966 numbered 1,401,000 head, down 3 percent from the 1,443,000 inventory a year earlier. Pullets amounted to 679,000 while hens totaled 692,000 head. Egg production during 1965 totaled 272 million eggs compared with 265 million in 1964.

TURKEYS—There were 50,000 turkeys on Colorado farms January 1, 1966, up 5,000 head from a year earlier. Total value of this inventory was \$265,000, up 34 percent from January 1, 1965.

COLORADO CROP REPORTING DISTRICTS

WHY CROP AND LIVESTOCK REPORTS

• • •

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
