1967 CROP REVIEW

Production of crops in Colorado during the 1967 season was quite good considering the adverse conditions encountered. Winter wheat and other fall grains encountered drought, freeze damage, insect infestation, hail storms, heavy rains, and stem and leaf rust, but production was still above average. Irrigated crops produced some outstanding area yields despite cool weather throughout the season. The index of all crop production amounted to 89 percent of the 1957-59 base. This was 2 points lower than in 1966. The wheat and rye production index amounted to 72 percent, compared with 88 percent for 1966. The index of feed grain production climbed 15 points to 102 percent of the base period.

Soil moisture at fall grain seeding time in the fall of 1966 was generally sufficient to germinate seed. Adequate stands of winter wheat, rye and winter barley were obtained. However, moisture remained short during the winter and through April, destroying much of the dryland acreage in east-central and southeastern sections of the State. Heavy infestations of cut-worms and high winds added to the damage. The drought was broken in mid-May. Freezing temperatures late in the spring caused additional damage to the wheat crop. However, the plants put out late tillers and produced more grain than had been anticipated. Heavy rains in June and July saved grain crops in many localities. Irrigation water supplies were boosted tremendously by the heavy rains and no serious shortages developed but below-normal temperatures prevailed through the summer months slowing growth and development of crops.

A total of 6,986,000 acres was planted to crops during 1967 by Colorado farmers. This was 8 percent more than the 6,456,000 acres utilized in 1966. These figures include the duplication arising because of replanting of abandoned winter wheat acreage to other crops. Acreage of all crops harvested in 1967 amounted to 5,335,000 acres, 8 percent less than in 1966 when 5,753,000 acres were harvested.

Crop yields per acre in 1967 were far better for many crops than had been anticipated. Corn, barley and oats produced record-high yields and dry beans and sorghums showed very fine per-acre returns. Production of corn for grain was the third largest of record, and the highest since 1930. The sorghum grain crop was 33 percent above the 5-year average. Winter wheat production, although 18 percent smaller than the previous year, exceeded the 5-year average by 19 percent.

Preliminary estimate of value of crops produced in Colorado during 1967 is \$262 million, 10 percent less than the \$290-million value placed on crops produced in 1966. The primary reason for this decline was a drop in the production and average price received for winter wheat. The values of broomcorn, barley, rye, potatoes, apples, peaches and pears also showed declines from the previous year. In contrast, value of corn, hay, beans, spring wheat, sorghum grain and sorghum forage was up.

Pastures and ranges were slow in starting during the early part of the season because of a shortage of soil moisture. However, heavy rains during the last of May and in June and July reversed the situation and an excellent grazing season developed.

WHEAT—Colorado's 1967 winter wheat crop was plagued by numerous adverse conditions throughout the season. Much of the crop succumbed to the elements, but the final output was 19 percent above the 5-year (1961-65)

average with 37,850,000 bushels produced. This was 18 percent less than the 45,972,000-bushel crop produced in 1966. Drought, cutworms, hail storms, freeze damage and stem and leaf rust caused widespread damage to the crop. Abandonment was especially heavy in southeastern and east-central areas. Of the 3,304,000 acres planted, only 1,941,000 acres were harvested for grain. This was 24 percent less than in 1966, but exceeded the 5-year average by 9 percent. An average yield per harvested acre of 19.5 bushels compares with the 18.0 bushels per acre for the previous year.

BARLEY AND OATS—Production of barley in Colorado during 1967 amounted to 10,992,000 bushels. This was 2 percent more than in 1966, but 9 percent less than the 5-year average. Harvested acres declined 18 percent from the previous year with only 229,000 acres cut for grain, compared with 279,000 acres harvested in 1966. Average yield per acre reached an exceptionally high 48.0 bushels, which exceeded the previous record high set in 1965 by 6.5 bushels. Oat production in 1967 was estimated at 2,988,000 bushels, 8 percent more than the previous year, but 18 percent less than the 5-year average. Harvested acreage declined 3 percent from the previous year to 72,000 acres. A new record-high yield per acre of 41.5 bushels more than offset the reduction in harvested acreage.

SUGAR BEETS—Sugar beet production in Colorado in 1967, at 2,094,000 tons, was down 10 percent from the previous year. This was 20 percent less than the 5-year average. A 9 percent drop in the acres harvested, to 127,700 acres, was a primary factor in the reduced production, although the average yield per acre, at 16.4 tons, was slightly below the 16.6 ton yield produced the previous year.

DRY BEANS—Production of dry beans amounted to 1,864,000 cwt., 1 percent less than both the 1966 production and the 5-year average. This output was harvested from 181,000 acres, which was 7 percent less than the previous year and 13 percent less than the 5-year average. Excellent yields, averaging 1,030 pounds per acre, nearly offset the reduction in acreage. Yields averaged 60 pounds higher than the previous year but 70 pounds less than the record-high yield of 1,100 pounds in 1963. Average yield from irrigated acreage was 1,830 pounds, compared with 1,760 pounds the previous year. Dryland acreage produced an average of 633 pounds per acre, compared with 466 pounds in 1966. Excellent quality beans were produced in the Southwest. Irrigated beans on the Eastern Slope suffered some limited damage where blight and rust were prevalent.

CORN—An excellent corn crop was produced during 1967 in Colorado with 20,736,000 bushels harvested. Production exceeded 1966 output by 16 percent and the 5-year average by 67 percent. This ranked as the third largest corn crop on record and the highest since 1930. Cool weather, which hindered development of the crop throughout the season, failed to reduce yields markedly. Average yield per acre set a new record high of 81.0 bushels per acre, exceeding the 1966 record high by 1 bushel and the 5-year average by 17.2 bushels. The crop was produced from 256,000 acres. A total of 528,000 acres of corn was planted for all purposes including silage and fodder. This represented a 17 percent increase from the previous year.

SORGHUM—Sorghum development was slowed by below-normal temperatures throughout the season. Luckily, an extended season was favorable for maturity and production for grain totaled 12,750,000 bushels, 35 percent higher than the previous year and 33 percent above average. Average yield

per acre in 1967, at 37.5 bushels, was only one-half bushel below the previous year's record high of 38.0 bushels per acre. The crop was harvested from a total of 340,000 acres, which was 37 percent higher than the previous year. Yields from irrigated acreage averaged 72.0 bushels per acre, the highest of record. Dryland acreage produced a 20.6 bushel yield compared with 23.8 bushels per acre in 1966. Acreage planted for all purposes amounted to 699,000, 39 percent more than for the previous year.

BROOMCORN—Production of broomcorn in Colorado fell sharply in 1967 and the crop amounted to only 4,100 tons. This was 25 percent below the previous year's output of 5,500 tons, and was 47 percent smaller than the 5-year average of 7,720 tons. It was the smallest crop produced in the State since 1952. Acreage harvested was down 14 percent at 36,000 acres. Yields per acre averaged 230 pounds, 30 pounds less than the 1966 yield and 29 pounds lower than the 5-year average. Heavy rains at planting time resulted in considerable replanting. Cool, wet weather during the season slowed growth and development, and hail storms caused some damage and abandonment. The first killing freeze in the fall stopped growth of some acreage and forced additional abandonment of the immature brush. Labor shortages at harvest time caused some marginal crops to be left unharvested.

HAY—Production of all hay in Colorado for the 1967 crop season is estimated at 2,888,000 tons, 4 percent more than the previous year. Harvested acreage increased 5 percent from the previous year to 1,507,000 acres. Average yield per acre of 1.92 tons compares with last year's average of 1.93 tons. Production of the major hay crop, alfalfa, amounted to 1,971,000 tons, 3 percent more than for the previous year. An average yield of 2.60 tons per acre was realized, compared with 2.55 tons in 1966.

POTATOES—Fall potatoes were favored with an excellent growing season. Production totaled 9,690,000 cwt., 13 percent more than during the previous year. Yields averaged a record high of 285 cwt. per acre compared with the previous year's 280 cwt. yield. Late summer potatoes, on the other hand, were produced under disappointing conditions and production fell 29 percent from the previous year to 2,100,000 cwt. This was 23 percent less than the 5-year average. Yields averaged a very poor 175 cwt. per acre, considerably less than the 225 cwt. yield produced in 1966.

MILLET—Production of millet in Colorado during 1967 totaled 845,000 cwt. This was 24 percent more than in 1966. Harvested acreage more than doubled in 1966 with 130,000 acres cut for grain, compared with 57,000 acres the previous year. Yields per acre were down sharply, averaging 6.5 cwt., compared with 12.0 cwt. per acre in 1966. Much of this increase resulted from plantings on abandoned winter wheat acreage.

COLORADO'S RANK IN AGRICULTURE AMONG THE STATES IN 1967

CROP OR LIVESTOCK ITEM	PRODUCTION OR NUMBER	RANK
Sheep on Feed (1/1/68).....	480,000 head	1

CROP AND LIVESTOCK INDEXES

Production indexes are used to combine production of the individual crop and livestock commodities to measure year-to-year changes in gross output. The period 1957-59 is used as the base period for this index. For each year the production of each commodity is multiplied by its 1957-59 average price to obtain a value for the base period. These values are totaled by groups and sub-groups, then divided by the comparable 1957-59 average value to obtain the percent each year is of the base period. By using a constant per-unit value for each commodity throughout the series, changes in this percent (or index) reflect the actual changes in production of the commodities from year to year.

The **index of livestock and poultry inventory** measures year to year changes in livestock numbers on farms (see page 70). The greater the index number the more livestock on hand January 1. The meat animal inventory index includes milk cattle since most of these are finally included in meat production. However, this is not duplicated in the all-livestock inventory index.

The **index of production of livestock and livestock products** measures the gross volume of livestock and livestock products, other than horses and mules produced during the year. This index has shown a steady increase in production since 1957, primarily because of an increase in the production of meat animals in the State.

The **index of crop production** measures the gross volume of crops produced during the year regardless of eventual disposition or use. This index includes all crops of importance in Colorado. Food grains and feed grains are the primary components of the series and have a marked effect on the over-all crop index.

¹Estimates for late summer and fall potatoes prior to 1959 are not comparable with those after 1959 due to a change in area designation of seasonal groups.

²Production and quantity sold figures are included in All Potatoes.

³Total stocks consist of "production less total disappearance to date." Disappearance includes all sales for all purposes to date, all potatoes eaten or fed on farms where produced to date and all losses to date through shrinkage, decay, dumping, etc.

⁴Preliminary.

COLORADO WHEAT VARIETIES

Scout wheat continues to increase in popularity and now threatens to overtake Wichita as the leading variety of winter wheat in Colorado. The most recent survey of winter wheat varieties planted for harvest in 1968 indicates that 29 percent of the total acreage planted to winter wheat was of the Scout variety. Wichita continued as the leading variety with 34 percent of the seeded acreage.

Wichita has been an important variety of winter wheat in Colorado since it first became prominent in 1949, reaching its peak of popularity in 1959 when 65 percent of the total winter wheat seeded was Wichita. This variety has been in the top spot each year since that time, though its importance has shown a steady decline. Certainly, this is a long period of time for a single variety to maintain the top spot.

A relatively new variety, Scout, has increased from .4 percent of the total seeded acreage for the 1965 crop to 29 percent for the 1968 crop. This variety has proven to have good yielding ability, and millers are well satisfied with its milling and baking qualities. It is early maturing, shows some rust resistance, and is strong standing.

Warrior, which was the second leading variety for the 1964-66 crops, continued in a very strong third position for 1968, accounting for 20 percent of all winter wheat acreage seeded. It was the leading variety in the northeast area. Warrior has remained popular because of its good yielding ability and favorable milling quality.

Scout, Wichita, and Warrior accounted for 83 percent of the State's total acreage seeded for the 1968 crop. Comanche was planted on 3.2 percent of the total acreage, ranking fourth, with Lancer in fifth place with 2.5 percent. In Northwest Colorado, a relatively new variety, Delmar, led with 42 percent of the total acreage followed by Itana with 33 percent.

In the Southwest, Comanche was the leading variety while Wichita and Scout ranked second and third, respectively. In the Southeast, Wichita was the leading variety followed by Scout. Other varieties showed relatively small percentages in this area.

FRUITS AND VEGETABLES 1967 SEASON

FRUIT CROPS—Colorado's 1967 bright early-season fruit prospects encountered devastating freezes during late April, causing record or near record-low production for each of the major fruit crops. The most critical freezes occurred on April 20-21, with losses being so severe that many trees did not produce any fruit during the season. No serious insect damage or disease problems were encountered and the overall fruit quality was good. Favorable weather prevailed during harvest and no serious labor shortages developed. Supplies of irrigation water were adequate throughout the State.

APPLE production in 1967 totaled 500,000 bushels (21.0 million pounds), sharply below the 1,350,000 bushels harvested in 1966. Spring freeze losses were most severe in Red Delicious orchards on the Western Slope, although considerable damage was also incurred by Jonathans. Only Golden Delicious and Rome Beauty produced crops that were as much as half the production of a year earlier. All other varieties were down more sharply. Harvest was completed about mid-October. Overall crop quality and fruit size was considered good despite the early season freeze damage.

PEACH growers in Colorado produced 140,000 bushels (6.7 million pounds), compared with 235,000 bushels in 1966. Severe freeze losses occurred in the two leading peach producing counties of Mesa and Delta. The small crop had excellent size and was of high quality, resulting in one of the most favorable returns per bushel in years for those growers who harvested some fruit. The main Standard Elberta harvest peaked on August 28 in Mesa County and September 1 in Delta County. Little cullage was required on the Standard Elbertas, whereas, a few July Elberta orchards had excessive cullage due to split pits and bird damage. The short crop caused no serious picking problems or personnel shortages for shed and sorting operations.

PEAR production, at 1,500 tons, was considerably below the 1966 production of 3,500 tons. Most harvesting of the Bartlett variety was completed by September 1 in Mesa County and September 10 in Delta County. And most of the Western Slope harvest was complete by mid-September, about two weeks ahead of normal. Some of the crop was diverted to processing due to freeze damage.

SWEET AND SOUR CHERRY growers produced the smallest crops in many years. Sweet cherry production during 1967, at 110 tons, was above the 60 tons harvested in 1966, but sharply below the 1964 and 1965 crops. Harvesting in the few Western Slope orchards which had escaped freeze damage was completed by July 10. Sour cherry production, at 690 tons, was slightly below the 700 tons produced in 1966, but sharply below the 1964 and 1965 crops. Harvest was virtually completed by August 1. About one-half of a normal crop was picked on the Western Slope and a small crop was picked in the Fort Collins area.

COMMERCIAL VEGETABLES

In 1967, the value of all vegetables grown in Colorado was \$14,872,000. This was a decrease of 30 percent from the 1966 value of \$21,224,000. This drop can be attributed to several factors including generally lower yields, which resulted in lower production, as well as lower prices on many crops. Lettuce, a major vegetable crop in Colorado, contributed heavily to the over-all decline in aggregate value. Although lettuce acreage was the same in 1967 as in 1966, lower yields and prices were responsible for a reduction in total value of over \$3,600,000.

The 1967 season was marked by late frost and generally cool weather in many parts of the State during the critical spring season. This, coupled with wind damage, particularly in the San Luis Valley, retarded growth and development. In Northern Colorado, hail damage was extensive on early onion transplants and some fields were disced up because stands were poor.

Growers of commercial vegetables in all parts of Colorado rely on irrigation throughout the growing season. Although wells are an important source of water in some areas, the supply of surface water is vital to many farmers. The 1966-67 winter produced a below-normal snowpack, despite late season snowstorms. Runoff was less than normal, but the State did not experience any major shortages. The South Platte and Arkansas Basins on the East Slope had good reservoir storage supplies from the previous year. The Arkansas Basin had 160 percent of average carryover.

Colorado's production of vegetables for fresh market accounted for 87 percent of the farm value derived from total vegetable production. In the 1967 National picture, Colorado ranked 6th in onion production, 8th in lettuce production, 8th in cucumbers for pickles and 3rd in spinach for fresh market. Colorado dropped from 15th place Nationally in 1966 to 21st in 1967 in value of total commercial vegetable production.

A wide variety of commercial vegetables are raised by Colorado farmers in various parts of the State. These range from thousands of acres of lettuce and onions to minor acreages of such crops as radishes and rhubarb. During the 1967 season, the leading crops in each area of the State were: Northern Colorado—onions, carrots, sweet corn, and cabbage; San Luis Valley—lettuce, spinach, and carrots; Arkansas Valley—onions, cantaloupes, and tomatoes; Western Slope—onions and tomatoes.

Colorado growers marketed 1,151,000 cwt. of onions during the 1967 season, down 9 percent from a year earlier, and down 27 percent from the 5-year (1961-65) average of 1,573,600 cwt. Total value of this crop is estimated at \$4,316,000, down 25 percent from the 1966 value of \$5,733,000. The total harvested crop of 1,475,000 cwt. was the lowest production since 1954.

Production of lettuce in Colorado, at 931,000 cwt., was down 17 percent from 1966 and down 33 percent from the 5-year (1961-65) average. This was the lowest production in 10 years. The total value of production was down 51 percent from the previous year, with an average price of \$3.85 per cwt. received in 1967, compared with \$6.20 in 1966. The 1966 unit price was the highest on record and, although the 1967 unit price was considerably lower, it is still \$.65 above the 5-year average of \$3.20 per cwt.

FARM INCOME AND PRICES

Cash receipts from farming and ranching in Colorado during 1966 reached a record high of \$888,698,000. This was 17 percent above the previous record established in 1965. Aggregate returns from each of the three major income categories—crops, livestock and Government payments—were higher than a year earlier. Income from marketings of livestock and livestock products in 1966 amounted to \$618,359,000, 20 percent more than a year earlier, and crop marketings totaled \$207,869,000 in 1966, up 15 percent. Government payments accounted for \$62,470,000, an increase of \$1,179,000 over 1965.

Prices received by farmers for their livestock and livestock products were generally higher in 1966 than in 1965. Sheep provided the single exception. Farmers also received higher average prices for most crops in 1966. Exceptions included oats, dry beans, pears, and alfalfa seed.

Preliminary 1967 cash receipts from farming and ranching in Colorado are estimated at \$865,215,000. This is 3 percent lower than in 1966. Sales of livestock and livestock products accounted for \$612,500,000, 1 percent less than in 1966. Cash receipts for crops totaled \$195,024,000, 6 percent less than in 1966. Government payments totaled \$57,691,000, a decrease of \$4,779,000 from the preceding year.

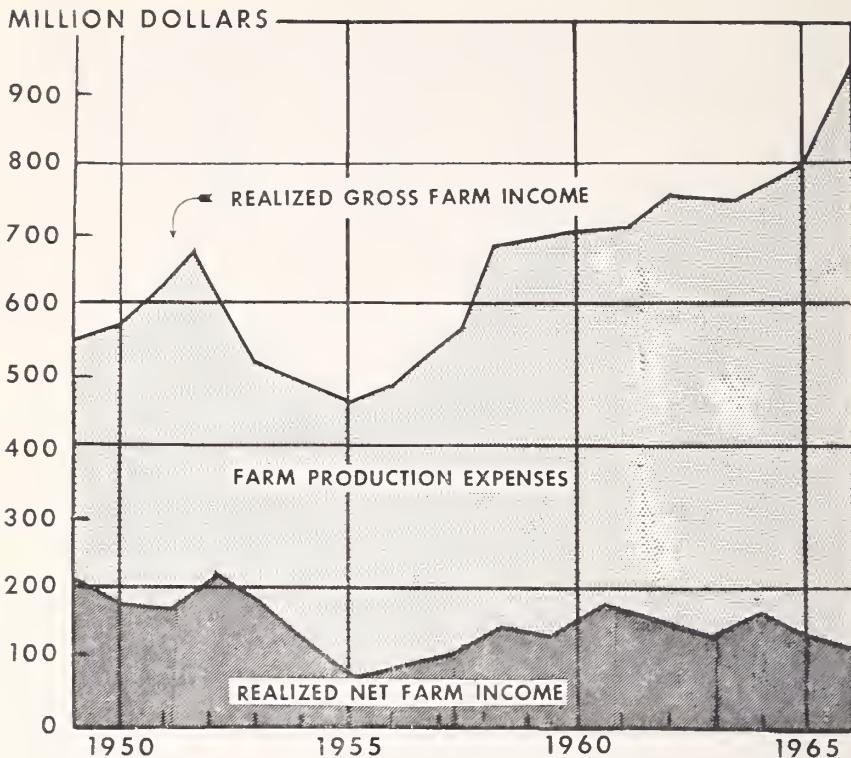

Prices received for livestock sold in 1967 were generally lower than in 1966. Hogs brought an average of \$19.60 per cwt. in 1967, compared with \$23.60 the previous year. Beef cattle prices averaged \$24.40 in 1967, compared with \$24.90 in 1966. Average prices received for most field crops in 1967 were lower than in 1966. Wheat declined from \$1.56 to \$1.29 per bushel, and potatoes from \$1.93 to \$1.60 per cwt. Hay prices increased from \$26.00 to \$26.50 per ton and prices received for fruit in 1967 were higher than in 1966.

¹Primary distribution weight. Approximately wholesale or processing level of distribution. Excludes quantities used in alcoholic beverages. ²Civilian consumption only. ³Carcass weight. ⁴Edible weight equivalent. ⁵Equivalent eviscerated weight.

⁶Farm weight equivalent beginning in 1961 includes quantities canned and frozen. ⁷Net canned weight. ⁸Cleaned basis.

⁹Includes cornstarch, breakfast cereals, and hominy. ¹⁰Preliminary. ¹¹Not available.

SUMMARY OF MONTHLY AND ANNUAL PRECIPITATION FOR COLORADO BY DISTRICTS¹

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Annual Total

LIVESTOCK INVENTORY AND VALUE

The index of livestock and poultry numbers on January 1, 1968 in Colorado was 142 percent of the 1957-1959 base period, unchanged from a year earlier. Increases in numbers of cattle, hogs and chickens were offset by declines in the number of sheep, lambs and turkeys on farms. The meat animal index exerts a strong influence on the all livestock index and at 142 showed no change from a year earlier. The poultry index, which measures turkey and chicken numbers, was 109 percent of the base period on January 1, 1968—10 percent above a year earlier as a result of higher chicken numbers.

The total value of livestock and poultry on Colorado farms January 1, 1968 was down 2 percent from a year earlier, principally because of lower prices. A drop in sheep and turkey numbers also contributed to the decline. The January 1 inventory value of Colorado livestock and poultry amounted to \$472 million compared with \$481 million a year earlier. Colorado continued to be the top ranking State in the number of sheep on feed and was in seventh place nationally for stock sheep and lambs on hand January 1, 1968, compared with sixth place a year earlier. Colorado ranked twelfth in the nation in number of all cattle and calves on hand January 1, 1968, while ranking fifth in the number of cattle on feed for that date.

Production of meat animals in Colorado during 1967 totaled 1.54 billion pounds compared with 1.39 billion pounds in 1966. This was an increase of 11 percent. Cash receipts from all species of livestock totaled \$611.9 million during 1967, an increase of 14 percent over the \$539.1 million of the previous year. This increase in cash receipts was entirely the result of an increase of marketings in 1967 over 1966 as prices received for cattle, hogs and sheep were lower than the previous year. Prices received for cattle and lambs during the first half of 1967 were substantially below a year earlier; however, during the last half of the year, cattle prices were above those a year earlier while lamb prices were edging up to the previous year's level. Prices received for hogs during 1967 were substantially below those received for 1966.

The year 1967 began with both ranges and livestock showing lower condition than a year earlier because of drought which had sharply reduced range feed supplies in the fall of 1966. Grazing was generally under par until the latter part of June when ranges began to show good growth because of heavy June rain. Condition of both cattle and ranges improved sharply and continued high through the fall grazing season. Grazing of winter wheat in the fall and early winter was quite limited on the Eastern Slope because of dry soil conditions. However, considerable use was made of corn stalks, sorghum stubble and other crop residue where available. Imports of stocker and feeder cattle from out of State during 1967 showed an increase over 1966, due in part to the good quality of grazing during the summer as well as the stronger demand by cattle feeders for replacements. Sheep imports, however, were below a year earlier.

ALL CATTLE AND CALVES—The January 1, 1968 inventory of cattle and calves in Colorado totaled 3,021,000 head compared with 3,017,000 head on January 1, 1967. Total dairy stock showed no change from a year earlier. Milk cows 2 years old and older declined slightly while milk heifers one to two years old showed a slight increase. Heifer calves for

milk numbered the same as a year earlier. Beef heifers one to two years old were up one percent from the previous year, and beef cows two years old and older were up 2 percent while beef calves were down 4 percent. Steers showed an increase of 3 percent while bulls one year old and older were unchanged. All cows (beef and dairy) two years old and older were one percent above a year earlier while all calves showed a decline of 4 percent. Total value of cattle and calves on farms was \$432 million, 1 percent less than a year earlier. This decline in inventory value was entirely the result of a lower average value per head on January 1, 1968, as total inventory numbers were somewhat higher than a year earlier. Value per head for cattle was \$143 at the beginning of 1968 compared with \$145 the preceding January.

DAIRY CATTLE—The January 1, 1968 inventory of cows and heifers two years old and older kept for milk totaled 106,000 head, 1,000 head less than a year earlier. The average number of milk cows on farms in Colorado during 1967 was 98,000 head, 1,000 head less than in 1966, the lowest on record for the State. Ten years earlier there were 143,000 head of milk cows in Colorado, on the average. More than offsetting the decline in number of milk cows was a new record-high milk output per cow. In 1967, Colorado cows averaged 8,460 pounds of milk compared with 8,290 pounds a year earlier. Ten years earlier, milk per cow averaged only 6,180 pounds. Total milk production for the year 1967 amounted to 829 million pounds compared with 821 million pounds during 1966, which was the lowest annual total on record.

CATTLE ON FEED—There were 637,000 head of cattle and calves in Colorado feedlots at the beginning of 1968. This was an increase of 5 percent over a year earlier. The number of cattle in feedlots is included in the January 1 total inventory of cattle and calves. There were 94 feedlots with a capacity of 1,000 head or more on January 1, 1968, compared with 87 a year earlier. Thirty of these feedlots had a capacity of 5,000 head or more and held 333,000 head at the first of the year. Feedlots with capacities of 500 to 999 head numbered 99 compared with 106 a year earlier and contained 52,000 head of cattle on feed. The smaller lots of less than 500 head capacity numbered 1,073 and contained 128,000 head of cattle on feed compared with 130,000 head on January 1, 1967.

On January 1, 1968, 76 percent of the cattle on feed in Colorado were being fed in the northeast district. A year earlier, this area fed 78 percent of the total. The east-central district accounted for 14 percent of the total number on feed January 1 compared with 13 percent a year earlier. The southeast district, in which the Arkansas Valley is located, had 10 percent of the State total compared with 9 percent a year earlier. Total marketings of fat cattle in the State during 1967 amounted to 1,330,000 head, an increase of 5 percent over 1966.

CALF CROP—There were 985,000 calves born in Colorado during 1967, a record-large calf crop for the State. The increase in calf crop was entirely the result of an increase in the number of cows two years old and older as the calving rate was below a year earlier. The 1967 calving season in Colorado was favorable with the absence of any major storms or cold weather. However, the condition of cattle and ranges in the fall of 1966 and the spring of 1967 was well below a year earlier primarily because of drought. This contributed to the lower percentage of calves saved compared with a year earlier.

SHEEP AND LAMBS—The number of sheep and lambs in Colorado on January 1, 1968, totaled 1,384,000, 9 percent lower than on January 1, 1967. Sheep on feed, included in the above figure, were down 6 percent from a year earlier. Stock sheep numbered 904,000 head while there were 480,000 sheep and lambs on feed. The number of stock ewes one year old and older, at 780,000 head, represented a decline of 8 percent from a year earlier. The value of stock sheep and lambs on January 1, 1968 in Colorado totaled \$21.4 million, 13 percent below January 1, 1967.

The 1967 lamb crop in Colorado was 850,000 head, down 7 percent from a year earlier. The average lamb crop for the period 1961-1965 was 1,067,000 head. The decline in number of lambs born continues a downward trend which started in 1960 and which has been broken only once—in 1966. The 1967 lambing season in Colorado was favorable with the absence of any major storms or cold weather; however, poor range and pasture conditions contributed to fewer lambs saved in some areas. Also, condition of stock sheep during the lambing season was somewhat below a year earlier although the condition was quite close to the 5-year average. Losses of lambs to predators continued to be a major concern of Colorado sheep producers.

SHEEP AND LAMBS ON FEED—As of March 1, 1967, there were 300,000 sheep and lambs on feed in Colorado. This was a decline of 9 percent from the same date a year earlier. By November 1, 1967, there were 510,000 sheep and lambs in Colorado on feed for the slaughter market. This was an increase of 4 percent over the same date in 1966. Feeder lambs started to move onto beet tops, alfalfa, and other crop residue shortly after mid-September and made excellent gains on available supplies. Limited amounts of corn stalk grazing started in some fields by November 1. Most Arkansas Valley feeders did not utilize the slowly developing Kansas fall wheat pastures prior to finishing in Colorado.

Sheep and lambs on feed for slaughter market in Colorado on January 1, 1968 totaled 480,000 head. This was 6 percent below the number on feed a year earlier and a decline of 9 percent from the 5-year (1962-1966) average of 529,000 head. Placements of lambs on feed in Colorado during November and December 1967, at 140,000 head, compared with 150,000 head placed during the same period a year earlier. Placements during November and December represented 29 percent of the total on feed January 1, the same as a year earlier. Colorado-fed lambs marketed during the last two months of 1967 totaled 170,000 head. There were 129,000 head sold during the corresponding period a year earlier. Feeder lambs made excellent utilization of beet tops and other crop residues during November and December. Wheat pasturing was less favorable than the previous year in all areas of the State. Losses from disease or over-eating appeared to be nominal relative to other years and no other serious feeding problems were encountered.

WOOL PRODUCTION—Wool production in Colorado during 1967 totaled 11,335,000 pounds, 6 percent below a year earlier. The number of sheep and lambs shorn totaled 1,271,000 head, down 6 percent from the 1,359,000 head shorn in 1966. Both the number of stock sheep shorn and the number of sheep and lambs shorn were below a year earlier. Fleece weight averaged 8.9 pounds per head, 0.1 pound above the previous year but 0.2 pound less than the 5-year (1961-1965) average of 9.1 pounds.

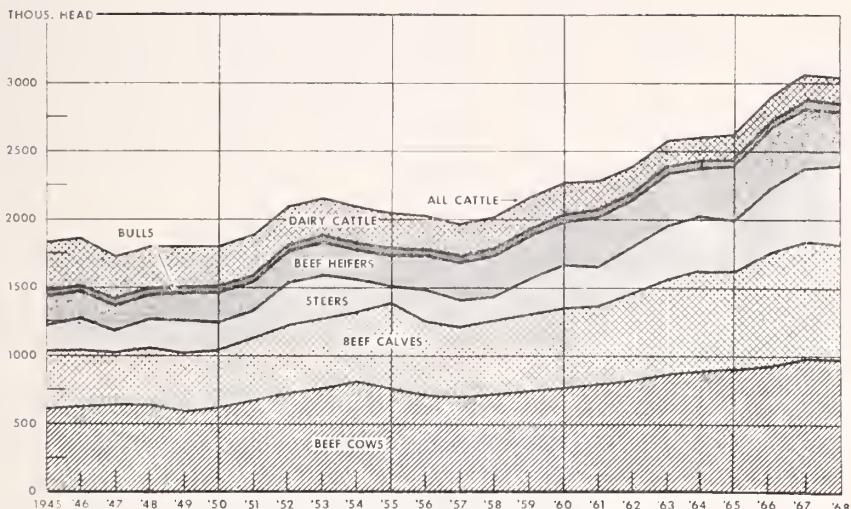

HOGS AND PIGS—There were 210,000 hogs on Colorado farms January 1, 1968. This was 12 percent above the January 1, 1967 inventory of

188,000 head and 16 percent above the 5-year (1962-1966) average of 181,000 head. Total value of the 1967 hog inventory was above the previous year despite an average value per head that was lower than in 1966. Average value per head on January 1, 1968 was \$27.20 compared with \$27.90 a year earlier. There were 224,000 head of hogs and pigs on Colorado farms December 1, 1967, 10 percent more than the 203,000 head a year earlier. The total includes 34,000 breeding hogs and 190,000 other hogs and pigs compared with 26,000 breeding and 177,000 other hogs on farms December 1, 1966. The 1967 spring pig crop in Colorado amounted to 175,000 head, an increase of 9 percent over the 1966 spring pig crop. Sows farrowed numbered 25,000 head compared with 22,000 a year earlier. The average number of pigs per litter was 7.0 compared with 7.3 pigs per litter in the spring of 1966. The 1967 June-November pig crop was estimated at 194,000 head, an increase of 11 percent over fall farrowings in 1966. There were 26,000 sows farrowed, 2,000 more than a year earlier. However, pigs per litter averaged 7.5 head compared with 7.3 for the previous fall.

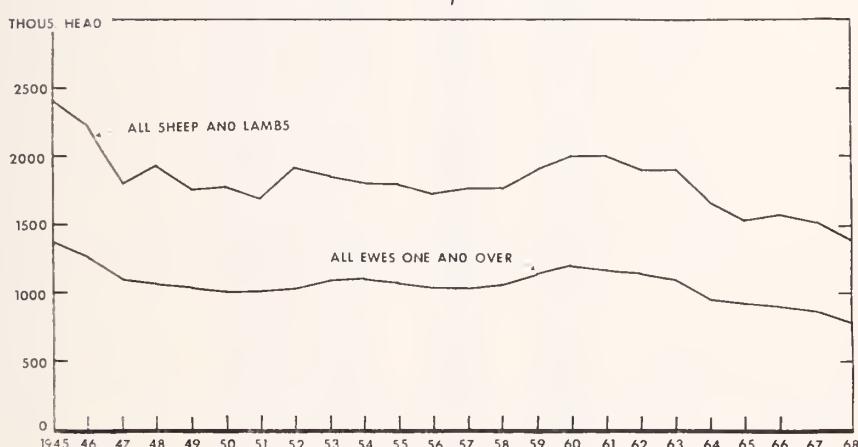

CHICKENS AND EGGS—All chickens on farms January 1, 1968 in Colorado numbered 1,843,000 birds, up 18 percent from the 1,558,000 inventory a year earlier. The inventory included 1,473,000 hens and pullets of laying age compared with 1,288,000 on January 1, 1967. Egg production during 1967 totaled 309,000,000 eggs compared with 246,000,000 eggs in 1966.

TURKEYS—There were 56,000 turkeys on Colorado farms January 1, 1968, down 10,000 head from a year earlier. Total value of this inventory was \$297,000 compared with \$409,000 on January 1, 1967.

WHY CROP AND LIVESTOCK REPORTS

• • •

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
