## 1968 CROP REVIEW

Aggregate production from all crops in Colorado during 1968 exceeded the 1967 output but was 9 percent less than during the 1957-59 base period. The index of all crop production for 1968 was 91 percent of the 1957-59 base, 4 points higher than the 87 percent for 1967. The index for winter wheat and rye production was 73 percent of the base period, 1 point higher than for 1967. On the other hand, feed grain production, at 95 percent of the 1957-59 base period was 6 points lower than for the previous year.

Preliminary value of crops produced in Colorado during 1968 is placed at \$299 million, virtually the same as in 1967. Increased production in 1968 was offset by lower prices for a number of crops. Value of wheat, corn, dry beans, potatoes, sorghum grain and barley showed declines from the previous year. Values for all fruit crops, hay, sorghum forage, rye, oats and broomcorn showed increased values from 1967.

Crop yields per acre in 1968 were favorable on irrigated land, but only fair from dryland acreages because of below-normal rainfall. Corn for grain and corn silage produced record-high yields. This was the sixth consecutive year that a new record-high was set for corn grain. Production of corn grain was the fourth largest of record and dry bean output was the largest since 1963. Alfalfa seed production dipped to the lowest level since 1928 while sorghum grain output dipped 17 percent from the previous year and fall potato harvest was 16 percent smaller.

Conditions for the 1968 crop season started out on a fairly optimistic note with soil moisture at fall seeding time in the fall of 1967 generally sufficient to germinate seed. However, moisture shortages prevailed throughout the season causing widespread damage to wheat and other dry-land crops in the southern half of the Eastern Plains. In addition to the drought damage, unusually severe infestations of cutworms and brown wheat mites caused widespread and serious damage on the Eastern Slope. Farmers were reluctant to spray for control of the insects in areas where moisture was in short supply, but in northeastern sections widespread spraying helped much of the acreage and reasonably good yields were obtained. Irrigation water supplies were generally sufficient in most areas where crops are customarily produced under irrigation, and favorable yields were realized. Crops were late in development throughout the State because of below-normal temperatures through much of the season. By late summer, it was feared that much acreage would be caught by killing frost, but fall temperatures were relatively mild and most crops matured without serious losses. Fall potatoes in the San Luis Valley and dry beans in southwestern Colorado sustained the most serious losses from freeze damage.

Colorado farmers planted a total of 6,748,000 acres to crops during 1968. This was 2 percent less than the 6,890,000 acres planted in 1967. These figures include duplication resulting from replanting of abandoned winter wheat acreage or other fall seeded grains to other crops. Acreage of all crops harvested in 1968 exceeded the 1967 total by 1 percent, with 5,281,000 acres harvested.

Pasture and range grasses were slow in developing during the spring because of the shortage of topsoil moisture. Range feed supplies were somewhat limited throughout the grazing season until late rains improved conditions. However, range feed supplies were not abundant even after the late rains.

**WHEAT**—Production of winter wheat in Colorado during 1968 was 38,320,000 bushels, exceeding the 1967 output by 3 percent. Drought conditions and infestations of cutworms caused losses of acreage in east-central and southeastern sections. Yield potentials were also reduced in some northeastern fields where early favorable prospects did not materialize. Farmers were able to harvest only 1,916,000 acres from 3,106,000 acres planted the previous fall. This placed the harvested acreage at the same level as was cut for grain in 1967. However, yield per harvested acre averaged 20.0 bushels compared with 19.5 bushels for the previous year and was the highest yield recorded since 1961.

**BARLEY AND OATS**—Barley production in 1968 dipped 5 percent from the previous year, totaling 10,904,000 bushels. Harvested acreage declined 2 percent to 232,000 acres, the smallest acreage harvested since 1934. On the other hand, yields were good, averaging 47.0 bushels or just 1.5 bushels less than the record-high set in 1967. Irrigated yields averaged 56.5 bushels per acre compared with 57.2 bushels in 1967 while dryland yields averaged 21.5 bushels, 10 bushels less than the 31.5 bushel yield the previous year. Oat production increased 7 percent to 2,804,000 bushels. Acreage harvested for grain totaled 71,000 acres, the second smallest of record dating back to 1909. Only the 1967 acreage was smaller. Average yield per harvested acre, at 39.5 bushels, compared with the previous year's record-high of 43.5 bushels.

**SUGAR BEETS**—Sugar beet production in Colorado during 1968 jumped 25 percent from the previous year with production placed at 2,621,000 tons. However, this was only 1 percent more than the 5-year average. Harvested acreage increased sharply from the previous year to a total of 169,100 acres, 33 percent more than in 1967. Yields averaged 15.5 tons per acre, 1 ton less than a year earlier.

**DRY BEANS**—Production of dry beans reached the highest level since 1963, totaling 2,042,000 cwt., an increase of 11 percent from the previous year. Yields from all acreage averaged 950 pounds per acre compared with 1,030 pounds in 1967. Irrigated yields averaged 1,658 pounds, somewhat less than the 1,820-pound yield for a year earlier. Dryland acreage produced an average yield of 430 pounds per acre, considerably less than the 642-pound yield in 1967. A substantial increase in harvested acres more than offset the reduction in yields. A total of 215,000 acres were harvested or 20 percent more than the 1967 acreage cut for beans. Quality of the bean crop was generally good except in southwestern Colorado where an early freeze caused discoloration of beans in some localities. An early frost in mid-August also reduced yield potentials in that area. Water supply for irrigated beans was generally ample except in the Arkansas Valley where shortages occurred from time to time.

**CORN**—Colorado corn producers harvested the fourth largest crop ever produced in Colorado with output totaling 20,418,000 bushels. This is 1 percent less than the 1967 crop, but exceeds the 5-year average by 36 percent. Yields averaged a record-high 83.0 bushels per acre making it the sixth consecutive year that the record has been raised. The crop was produced from 246,000 harvested acres, 5 percent less than was picked the previous year. Corn planted for all purposes including silage and fodder amounted to 491,000 acres, 2 percent less than in 1967. Development of the 1968 corn crop was slowed by below-normal temperatures through much of the season, but killing frosts came late and the crop matured without any serious damage.

**SORGHUM**—Sorghum grain production in 1968 amounted to 10,295,000 bushels, 17 percent less than produced the previous year. An average yield per harvested acre of 35.5 bushels was reaped, one-half bushel less than in 1967. Irrigated acreage yielded an average of 70.0 bushels per acre while dryland yields averaged 19.7 bushels compared with 72.0 bushels and 21.3 bushels, respectively, for 1967. The crop was produced from 290,000 harvested acres which was 16 percent less than cut the previous year. Acreage planted for all purposes including silage and forage totaled 613,000, 7 percent less than the previous year. Below normal seasonal temperatures prevented the crop in most areas from reaching its full yielding potential. However, a late fall enabled the crop to reach maturity without any serious damage. In 1968, greenbugs attacked sorghum plants for the first time, causing considerable reduction in yield in many fields.

**BROOMCORN**—Colorado's 1968 broomcorn crop at, 4,200 tons, was 100 tons less than the previous year's small crop. Production at this level was 41 percent less than the 5-year average output. Average yield of brush per acre was 220 pounds compared with the previous year's 230-pound yield. Considerable replanting was necessary because of wind damage and lack of soil moisture. Cool temperatures and dry conditions slowed development, but freezing temperatures held off until late fall enabling the crop to mature and good quality brush was harvested.

**HAY**—Production from all hay crops in Colorado was approximately the same as the previous year of 2,858,000 tons. The crop was produced from 1,491,000 acres harvested with yields averaging 1.92 tons per acre. Production from the major hay crop, alfalfa, was also virtually the same as the previous year at 1,912,000 tons. Yields averaged 2.55 tons per acre just slightly lower than the 2.60-ton yield for 1967.

**POTATOES**—Fall potato production in 1968 dipped sharply from the previous year to only 7,762,000 cwt. which is 16 percent less than produced in 1967 and the smallest fall potato crop since 1964. Yields averaged 225 cwt. compared with a very fine 275-cwt. yield in 1967. An early freeze stopped development of the crop before the tubers had sized fully which was primarily responsible for the reduction in yield. Late summer potatoes fared much better and the 3,243,000 cwt. was the largest produced since 1960. Compared with the 1967 output it was a 37-percent larger crop. The average yield of 230 cwt. was considerably higher than the 185-cwt. yield in 1967 and the highest of record dating back through 1959.

**MILLET**—Millet grain production in Colorado during 1968 amounted to 1,840,000 cwt., nearly 2½ times as large as the 1967 harvest of 780,000 cwt. Harvested acreage, at 160,000 acres, was a third larger than the 1967 crop. Yield per acre averaged 11.5 cwt., considerably higher than the 6.5 cwt. yield in 1967, but well in line with the 12.0 cwt. yield for 1966. Much of the millet was produced on winter wheat acreage which was abandoned because of loss of stands.

**ALFALFA SEED**—The 1968 season was a very poor one for producing alfalfa seed with output at the lowest level since 1928. Seed production amounted to only 540,000 pounds, 22 percent less than in 1967 and 76 percent smaller than the 5-year average. Yields averaged 120 pounds per acre, 5 pounds more than the previous year. Harvested acreage was only 4,500 acres, the smallest since 1928 and 25 percent less than in 1967. Poor pollination, unfavorable weather conditions and a general lack of interest in seed production were largely responsible for the small crop.

## COLORADO'S RANK IN AGRICULTURE AMONG THE STATES IN 1968

CROP OR LIVESTOCK ITEM	PRODUCTION OR NUMBER	RANK
Sheep on Feed (1/1/69).....	480,000 head	1
Broomcorn.....	4,200 tons	2
Sugar Beets.....	2,621,000 tons	3
Dry Beans.....	2,042,000 cwt.	3
All Sheep & Lambs (1/1/69).....	1,337,000 head	4
Lettuce.....	918,000 cwt.	4
Spinach, fresh market.....	66,000 cwt.	6
Wool Production.....	10,455,000 lbs.	6
Sorghum, forage.....	253,000 tons	6
Cantaloups.....	240,000 cwt.	6
Cherries, tart.....	1,700 tons	6
Cattle on Feed (1/1/69).....	711,000 head	7
Sorghum, silage.....	275,000 tons	7
Pears.....	6,000 tons	7
Onions.....	1,769,000 cwt.	8
Cucumbers, for pickles.....	20,100 tons	8

## CROP AND LIVESTOCK INDEXES

Production indexes are used to combine production of the individual crop and livestock commodities to measure year-to-year changes in gross output. The period 1957-59 is used as the base period for this index. For each year the production of each commodity is multiplied by its 1957-59 average price to obtain a value for the base period. These values are totaled by groups and sub-groups, then divided by the comparable 1957-59 average value to obtain the percent each year is of the base period. By using a constant per-unit value for each commodity throughout the series, changes in this percent (or index) reflect the actual changes in production of the commodities from year to year.

The **index of livestock and poultry inventory** measures year to year changes in livestock numbers on farms (see page 70). The greater the index number the more livestock on hand January 1. The meat animal inventory index includes milk cattle since most of these are finally included in meat production. However, this is not duplicated in the all-livestock inventory index.

The **index of production of livestock and livestock products** measures the gross volume of livestock and livestock products, other than horses and mules produced during the year. This index has shown a steady increase in production since 1957, primarily because of an increase in the production of meat animals in the State.

The **index of crop production** measures the gross volume of crops produced during the year regardless of eventual disposition or use. This index includes all crops of importance in Colorado. Food grains and feed grains are the primary components of the series and have a marked effect on the over-all crop index.

**CROP AND LIVESTOCK PRODUCTION, COLORADO, 1935-1968**  
Index Numbers (1957-1959 = 100)

Year	ALL FARM PRODUCTION	LIVESTOCK & LIVESTOCK PRODUCTS				CROPS

<sup>1</sup>Production and quantity sold figures are included in "All Potatoes."

<sup>2</sup>Total stocks consist of "production less total disappearance to date." Disappearance includes all sales for all purposes to date, all potatoes eaten or fed on farms where produced to date and all losses to date through shrinkage, decay, dumping, etc.

<sup>3</sup>Preliminary.

## COLORADO WHEAT VARIETIES

Wichita and Scout reigned as the most popular Colorado winter wheat varieties planted for harvest in 1969. Wichita continued as the leading variety with 34 percent of the seeded acreage, but accounted for only about half the percentage of the total accounted for in 1959 when it was at peak popularity. Most of its decline is related to the popularity of several new varieties introduced since that time.

The most popular new variety, Scout, continued its increase with 30 percent of the total acreage planted for 1969 harvest. Scout's rate of increase leveled off in 1969 but Scout's high yield, good milling and baking qualities, and favorable agronomic characteristics give strong support to its increasing popularity.

Warrior, the third leading variety the past two years, remained in that position for 1969 with 20 percent of the total planted winter wheat acres. Warrior also has been a good yielder with favorable milling qualities.

Lancer, a relatively new variety, moved up to a solid fourth place with 4.5 percent of the total winter wheat acres planted, nearly double the amount of Lancer planted for 1968. This wheat has shown stem rust resistance and is known to produce good yields.

The above four leading varieties accounted for 88 percent of Colorado's winter wheat varieties planted for the 1969 harvest.

Delmar, another relatively new variety, ranked seventh in percentage of total acres planted. Its popularity can be related to its dwarf bunt resistance. This disease is very prevalent in northwestern Colorado where 98 percent of the State's total Delmar acreage is located.

Two new varieties, Trapper (1 percent of winter wheat acres seeded) and Trader (0.6 percent of the total), are showing up for the first time. Seed was limited for the 1969 crop. Most of the grain harvested in 1969 from these two varieties is expected to be used for seed. Therefore, the 1970 acreage may be increased sharply.

In the Northwest, Delmar led the district in total acres planted to winter wheat and Itana was second. In the Northeast, Warrior held the lead, Scout was second, and Wichita came in third. In the East Central area, Wichita led while Scout and Warrior were second and third respectively.

In Colorado's southwest district, the old favorite, Comanche, kept the lead but is losing ground to second place Scout. In the Southeast, Scout took a good lead while Wichita ranked second.

In 1968 the top four winter wheat varieties, Wichita, Scout, Warrior, and Comanche, accounted for 85 percent of the total winter wheat acreage harvested in Colorado.

Lancer, one of the newer major varieties, was the State's top yielding variety of hard red winter wheat in 1968. Lancer is grown mainly in the northeast and east central parts of the State. Of the three most popular varieties—Wichita, Scout and Warrior—Warrior led in yield per acre. Scout, popular except in the Northwest, averaged just above the 20.9-bushel average for all varieties. Wichita averaged 3.5 bushels per acre less than the State average. The northeast district topped the State with a 24.4-bushel-per-acre average.

The extreme variations in growing conditions between areas in 1968 and the distribution of varieties by areas must be borne in mind in appraising the difference in yield by varieties. Apparently, Wichita suffered most from the adverse conditions in eastern Colorado where most of the Wichita acreage was located in 1968.

## FRUITS AND VEGETABLES 1968 SEASON

**FRUIT CROPS**—Colorado's fruit crops got off to their best start since 1965 and sustained only slight damage as the 1968 season progressed. April was cool but only a few orchards were hurt by frost. Nearly all orchards had an abnormally heavy June drop. Crops matured under favorable weather conditions although the peach crop did not size properly because of cool weather toward the end of the season. There were no serious labor shortages and irrigation supplies were adequate.

**APPLES**—The 1968 apple crop was estimated at 74.5 million pounds, (1,750,000 bushels), up sharply from the preceding year's production of 22.9 million pounds (535,000 bushels). Most orchards received only light freeze damage in the spring. A heavy June drop, however, did reduce early expectations. Crop quality was very good for most varieties. Red Delicious, accounting for 33 percent of the State's production, was the leading variety produced. Jonathan followed Red Delicious closely with 27 percent of the total.

**PEACH** production in Colorado, at 790,000 bushels, (38.0 million pounds) compared with 140,000 bushels, (6.7 million pounds), harvested in 1967. Some orchards were frosted in April but damage was light. Excellent early season expectations were not reduced until the crop failed to size properly in August, causing excessive cullage. Harvesting of the Standard Elbertas was at peak near September 1 in Mesa and Delta Counties. There were no serious insect problems as most producers sprayed before much damage could occur.

**PEAR** growers produced 5,700 tons during 1968, about four times the 1967 output. Harvest of early varieties began by mid-August and nearly all of the crop was harvested by September 7. The 1968 crop was marketed in good condition and size. A very small part was diverted to processing.

**SWEET AND TART CHERRY** production during 1968 was above the previous two year's output. The 1968 production of sweet cherries, at 200 tons, is well above the 110 tons harvested in 1967. Freeze damage in late April and early May, however, held production far below the 1964 and 1965 output of 1,100 tons. Harvest was completed by July 20. The tart cherry crop, at 1,800 tons, was well above 1967 and the largest since 1961. Tart cherry orchards received slight freeze damage on the Western Slope while Fremont and Larimer County growers escaped with practically no damage and harvested their best crops in years. Harvest was completed by August 1 in all counties except Delta where rains delayed completion until mid-August.

## COMMERCIAL VEGETABLES

Vegetable growers in Colorado produced at a high level in 1968 despite a cool spring which retarded early growth and development. Other damaging conditions, such as hail, occurred only in widely scattered areas throughout the growing season. In the San Luis Valley excessive rain in late July and August caused some abandonment of lettuce acreage and lowered yield expectations.

A hot spell in June caused considerable damage to the lettuce crop in the Arkansas Valley due to tip burn. This was followed by hail and approximately 25 percent of the crop there was lost.

The onion crop got off to a slow start in all areas due to a cool spring and many thin stands were evident around the State. But favorable growing conditions during the summer months improved growth and development and good yields were realized. Losses of onions in storage ran much higher than in previous years on the Western Slope and Northern Colorado. This was due mainly to frost damage and the large number of green onions put into storage.

In 1968 the value of all vegetables grown in Colorado reached \$18,593,000 an increase of 15 percent compared with the 1967 crop of \$16,148,000. The value of production for cantaloups and cabbage were up sharply and contributed significantly to this increase.

Vegetable growers in all parts of Colorado irrigate their crops throughout the growing season. This in part accounts for the States vegetable yields being consistently higher than the National average on most crops. In 1968, irrigation water supplies in reservoirs was near average at the beginning of the summer. Water supplies were generally adequate to meet irrigation demands throughout the State and stream flow was near the 1948-62 average.

Colorado's 1968 production of vegetables for fresh market accounted for 84 percent of the farm value derived from total vegetable production. Nationally, Colorado ranked 8th in onion production, 4th in lettuce production, 8th in cucumbers for pickles and 6th in spinach for fresh market.

Onion growers marketed a total of 1,344,000 cwt. of onions during the 1968 season. This is an increase of 2 percent over 1967 and is 7 percent above the 1966 marketed production of 1,260,000 cwt. Onions ranked as the leading vegetable crop in terms of value in 1968.

Production of lettuce, at 918,000 cwt., was down slightly from the previous year and down 19 percent from the 1966 production of 1,127,000 cwt. This also represents the lowest level of production since 1958. The total value of production, at \$3,626,000, was up 7 percent from 1967 but 48 percent below the record high value set in 1966. The average price received in 1968 of \$3.95 per cwt. is higher than that received in 5 of the last 10 years but is well below the \$6.20 per cwt. received in 1966.

Colorado farmers raise a wide variety of commercial vegetables in various parts of the State, but each of the main vegetable producing areas have a few crops that usually account for most of the area's total farm value derived from vegetables. During 1968, the leading crops in each area were: Northern Colorado—onions, carrots, sweet corn, cabbage; San Luis Valley—lettuce, spinach, carrots; Arkansas Valley—onions, cantaloups, tomatoes; Western Slope—onions and tomatoes.

## FARM INCOME AND PRICES

Realized net farm income to Colorado farm and ranch operators in 1967 totaled \$137,900,000. This was 15 percent less than in 1966. Farm production expenses were up 12 percent from 1966—higher than any previous year. Cash receipts from farm marketings totaled \$885,283,000, up 8 percent from 1966. Lower returns from crops were more than offset by higher cash receipts from livestock and livestock products. An additional \$57,606,000 was received in the form of government payments, compared with \$62,470,000 a year earlier.

Prices received by farmers for most livestock and livestock products were lower in 1967 than in 1966. Vegetable prices were lower in 1967, but a majority of other crops brought higher prices than in 1966.

Preliminary 1968 cash receipts from farm marketings in Colorado are estimated at \$948,721,000, compared with \$885,283,000 in 1967. Sales of livestock and livestock products totaled \$732,672,000, 7 percent higher than in 1967. Cash receipts from crops increased 8 percent to \$216,049,000.

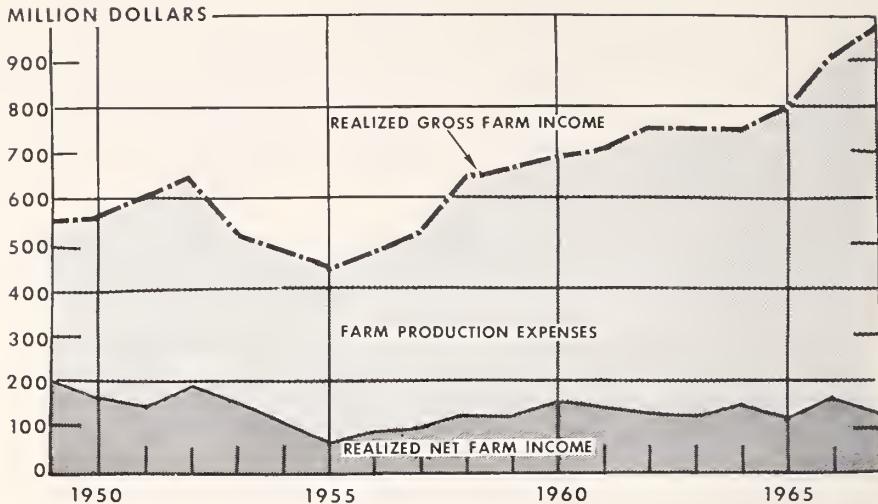

Prices in 1968 were higher for cattle, calves, lambs, turkeys, milk, wool, broomcorn, cabbage, lettuce, and tomatoes.

## LIVESTOCK INVENTORY AND VALUE

The index of livestock and poultry numbers in Colorado on January 1, 1969, was 146 percent of the 1957-59 base period, 2 points above a year earlier. The meat animal inventory index—the major component of the livestock index—at 146, was 2 points above the previous year. The poultry index, which measures turkey and chicken numbers, was 121 percent of the base period on January 1, 1969, 6 points above a year earlier. Only sheep and lamb numbers showed a decline from January 1, 1968.

The total value of livestock and poultry on Colorado farms January 1, 1969, was up 8 percent from a year earlier. This resulted from increases in both livestock numbers and prices. The January 1, 1969 value of the Colorado livestock and poultry inventory was \$518 million compared with \$477 million a year earlier.

Colorado has been the top ranking State in number of sheep on feed over a long period of years, and continued in this position of leadership on January 1, 1969. The State was in seventh place in total number of stock sheep and lambs, the same ranking position as a year earlier. Colorado also ranked seventh in the nation in number of all cattle and calves on feed January 1, 1969, while ranking eleventh in number of beef cows two years old and older. A year earlier Colorado ranked tenth in number of beef cows. The State ranked twelfth in all cattle and calves, eighteenth in turkeys, twenty-sixth in hogs, and thirty-sixth in numbers of chickens on hand at the beginning of the year.

Production of meat animals in Colorado during 1968 totaled 1.51 billion pounds compared with 1.54 billion pounds in 1967. This was a decrease of 1 percent. Cash receipts from all species of livestock totaled \$612.2 million during 1968, an increase of 2 percent over the \$600.7 million of the previous year. This increase in cash receipts was a result of higher prices for cattle and hogs in 1968 compared with 1967, as well as higher production for hogs. Beef cattle prices began to climb early in 1968 and by June were the highest for the month since 1952. This situation continued through the end of the year. Lamb prices during 1968 averaged higher than a year earlier throughout the entire year and were generally the highest since 1951-52. Prices received for Colorado hogs during 1968 averaged below 1967 and were the lowest for any year since 1964.

Ranges greened up very slowly in the spring of 1968 because of dry soil condition over most of the State. It was not until rains came in May and June that ranges began to supply adequate green feed. Condition of cattle and sheep improved in the early fall when ranges were showing the full benefit of the summer's rains. Condition of cattle remained generally good through the end of the year, because of open ranges during the early winter months on the Eastern Slope. Western Slope sheep experienced some difficulty in areas of heavy snowfall. Grazing of winter wheat in the fall and early winter was very limited on the Eastern Slope because of dry soil conditions. Imports of stocker and feeder cattle from out of State during 1968 showed a 2 percent decline from 1967 due in part to the lack of winter wheat pasture on the Eastern Slope. Imports of sheep and lambs into Colorado, however, were substantially above a year earlier, due in part to relatively good fed lamb prices.

**ALL CATTLE AND CALVES**—Inventory of cattle and calves in Colorado totaled 3,119,000 head, on January 1, 1969 compared with 3,060,000 head a year earlier. All classes of beef cattle except cows showed increases

over January 1, 1968. Beef heifers one to two years old increased 2 percent from the previous year while beef calves showed a 3 percent increase. Steers one year old and older were up 6 percent while bulls showed no change from a year earlier. All cows two years old and older totaled 1,105,000 compared with 1,107,000 on January 1, 1968. All calves showed an increase of 3 percent over a year earlier. Total inventory value of cattle and calves on farms was \$474 million, 8 percent more than a year earlier. The increase in inventory value resulted from both a higher value per head and a larger inventory. Value per head for cattle was \$152 at the beginning of 1969 compared with \$143 the preceding January.

**DAIRY CATTLE**—The January 1, 1969 inventory of cows and heifers two years old and older kept for milk totaled 110,000 head, 1,000 head more than a year earlier. The average number of milk cows on farms in Colorado during 1968, was 99,000 head, 1,000 head more than in 1967. Colorado milk cows produced an average of 8,530 pounds of milk per cow during 1968, compared with 8,460 pounds in 1967. Total milk production for the year 1968 amounted to 844 million pounds, compared with 829 million pounds during 1967.

**CATTLE ON FEED**—There were 711,000 head of cattle and calves in Colorado feedlots at the beginning of 1969. This was an increase of 13 percent over the 628,000 on feed January 1, 1968. The number of cattle in feedlots is included in the January 1 total inventory of cattle and calves. There were 1,431,000 fed cattle marketed out of Colorado feedlots during 1968, an increase of 8 percent over the 1,319,000 head marketed during 1967.

Of the cattle and calves on feed January 1, 1969, steers one year old and older were up 8 percent from a year earlier, while one to two year-old heifers were up 16 percent. Calves on feed, although small in number, showed an increase of 51 percent from January 1, 1968.

Total number on feed on January 1, 1969 was up in all regions of the State but there were shifts in the percentage of total accounted for by the various regions, as indicated by the following comparisons: Seventy-two percent of the total were being fed in the Northeast district. A year earlier this area fed 76 percent of the total. The East Central district accounted for 15 percent of the total number on feed January 1 compared with 14 percent a year earlier. The Southeast district in which the Arkansas Valley is located, had 12 percent of the State total compared with 10 percent a year earlier. A relatively small number of cattle are fed in Western Colorado.

**CALF CROP**—There were 1,030,000 calves born in Colorado during 1968, a record-large calf crop for the State. The increase in calf crop was a result of the increased number of cows two years old and older at the beginning of the year. The calving rate was the same as in 1967. Cows were generally in good condition with adequate feed supplies during the calving season. Weather was mostly favorable so losses of new born stock were at a minimum.

**SHEEP AND LAMBS**—There were 1,337,000 sheep and lambs in Colorado on January 1, 1969, down 2 percent from a year earlier. Sheep on feed are included in the above figure. Stock sheep numbered 857,000 compared with 884,000 on January 1, 1968, a decline of 3 percent. The number of stock ewes one year old and older at 740,000 was also 3 percent below the previous year. The value of stock sheep on January 1, 1969 in Colorado was \$23 million, 8 percent above January 1, 1968.

**LAMB CROP**—The 1968 lamb crop in Colorado was 762,000 head, down 10 percent from 1967. The 1968 lamb crop as a percent of total ewes was 2 percentage points higher than in 1967. The lambing season was generally favorable in 1968 in each of the major producing areas. Neither storms nor disease took an unusually heavy death toll as in some prior years. Predators continue to be a serious problem.

**SHEEP AND LAMBS ON FEED**—There were 275,000 sheep and lambs on feed March 1, 1968. This was a decline of 8 percent from the same date a year earlier. By November 1, 1968, there were 560,000 sheep on feed for the slaughter market. This was an increase of 10 percent over November 1, 1967, and the largest November 1 number on feed since 1962. Average weight of lambs on feed in Colorado November 1, 1968 was heavier than a year earlier. Placements of sheep and lambs on beet tops, wheat and other vegetation started around mid-September. Sugar beet harvest was virtually completed by November 15, the same as a year earlier. Corn and sorghum fields also provided residue feed for lambs before placement in feedlots. Wheat fields were utilized to a very limited extent on the Eastern Plains.

Sheep and lambs on feed for slaughter market in Colorado on January 1, 1969, totaled 480,000, the same as the year earlier, but 30,000 below the 510,000 on feed January 1, 1967. Placements of lambs on feed in Colorado during November and December 1968, at 116,000, compared with 140,000 for the same period in 1967. Placement during November and December represented 24 percent of the total number on feed January 1 compared with 29 percent a year earlier. Colorado-fed lambs marketed during the last two months of 1968 totaled 196,000, 15 percent above marketings for the corresponding period in 1967. Open weather during November and December allowed sheep and lambs to clean up corn fields, sorghum stubbles, and other crops residue, and to take full advantage of beet tops. Wheat pasture was very limited throughout the State because of dry soils.

**WOOL PRODUCTION**—Wool production in Colorado during 1968 totaled 10,455,000 pounds, 9 percent below a year earlier. The number of sheep and lambs shorn totaled 1,182,000 head, down 7 percent from the 1,271,000 head shorn in 1967. Fleece weight averaged 8.8 pounds per head, 0.2 pound below the previous year but the same as in 1966.

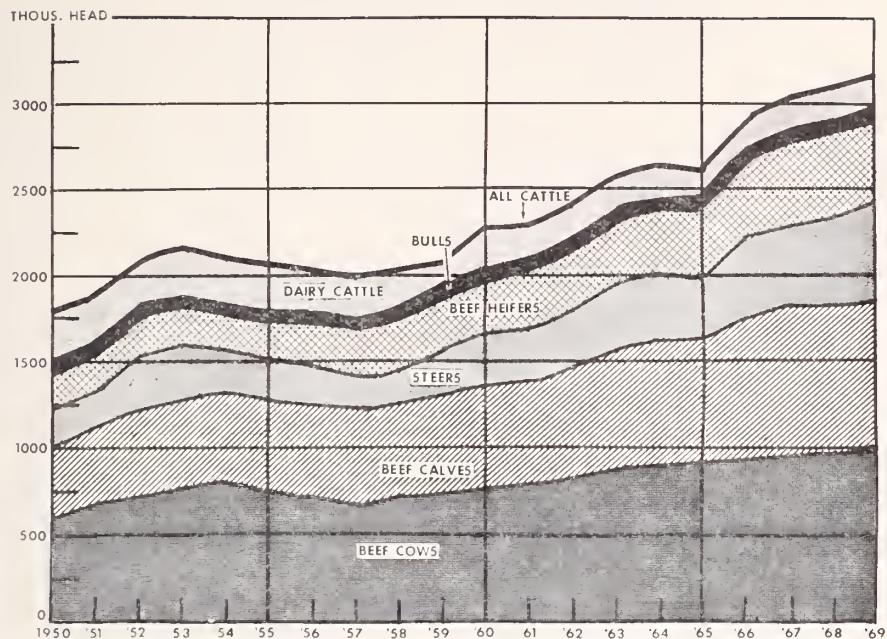

**HOGS AND PIGS**—There were 230,000 hogs on Colorado farms January 1, 1969, up 11 percent from the January 1, 1968 inventory of 207,000. Total value of the January 1, 1969 hog inventory, at \$6.5 million, compares with \$5.5 million on January 1, 1968. Average value per head on January 1, 1969, was \$28.20 compared with \$26.40 a year earlier. There were 240,000 hogs and pigs on Colorado farms December 1, 1968, an 11 percent increase over the 216,000 a year earlier. The December 1, 1968 total includes 35,000 breeding hogs and 205,000 market hogs and pigs. This compares with 33,000 breeding hogs and 183,000 market hogs on hand December 1, 1967. The 1968 June-November pig crop was estimated at 212,000, 13 percent over fall farrowings of 1967. These pigs were farrowed from 29,000 sows, with an average litter size 7.3 pigs. The 1968 December-May pig crop was set at 180,000, 3 percent over spring farrowing of 1967. Spring-farrowed sows numbered 25,000 with an average litter size of 7.2 pigs.

**CHICKENS AND EGGS**—On January 1, 1969, Colorado farmers had 1,935,000 chickens on hand, up 2 percent from the 1,897,000 inventory a year earlier. Hens and pullets of laying age numbered 1,529,000 compared with

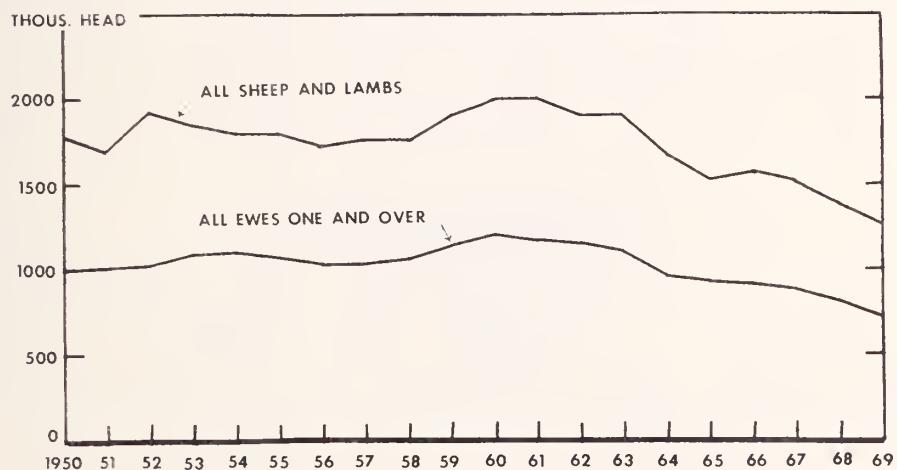

1,527,000 the previous year. Pullets not yet of laying age accounted for 396,000 head of the January 1, 1969 total. Egg production during 1968 totaled 300 million eggs compared with 309 million in 1967.

**TURKEYS**—Turkeys in Colorado at the beginning of 1969 numbered 76,000 birds compared with 65,000 a year earlier. There were 37,000 breeder hens on hand, the same as on January 1, 1968. Total value of this inventory was \$437,000 compared with \$344,000 a year earlier.

## WHY CROP AND LIVESTOCK REPORTS

• • •

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
