THE 1970 CROP REVIEW

1

The current season got off to an excellent start in the fall of 1969 with excellent moisture conditions for fall seeded grains throughout the State. The condition for these grains was the best in many years and was the basis for what proved to be a record high wheat crop. Periods of cold temperatures and blowing soil in the spring of 1970 caused limited damage to fall-sown grains in the east and southeast areas, but not nearly as much as in recent years. The cool temperatures caused a late start for spring grains and row crops, but conditions were favorable by the early part of June and development of all crops was generally on time. In May, it appeared that a dry period, which is normal in Colorado, would hinder the development of the wheat crop but general rains at the end of May and the first week of June pushed the grain fields to one of their best outputs. Snowfall in the mountains had accumulated quite heavily during the winter and irrigation water supplies were adequate to plentiful throughout the State. Rainfall on the Eastern Plains developed the wheat crop, and by late June the first fields had been cut in the southeast area. It then became fully apparent that Colorado had an excellent wheat crop. Weather was favorable during the wheat harvest and it progressed at a rapid pace throughout the State.

Spring seeded crops also responded to the moisture and the warm weather which prevailed during the first of July. Spring barley and oats were in the very best of condition with only small pockets of damage from hail occurring to the crop. Sugar beets also were making excellent growth, and while their final output was not as high as earlier expected, it still ranks as an excellent crop. The State's corn and sorghum crops were waiting for the fair weather and, with the advent of warm temperatures, developed at an exceptionally good rate. Seeding of dry beans was also a little late but nearly all of the crop was in the ground by the first of July with only some hailed acreage left for replanting. A dry period in the southwest corner which began in early August and continued to approximately mid-September reduced potentially high bean yields. However, the crop was far along in development and the first pod set was made, which followed the final outturn still to be respectable.

As fall progressed, the corn and sorghum crops matured and generally were safe from the first killing frost. However, wet weather in early October slowed the harvest of corn, sorghum, and sugar beets, but the cold temperatures were not severe enough to cause damage. Though a little slower than normal harvest, the crops were generally put under cover by the first of December.

Hay production in the State was close to an all-time high as all types of hay responded to the excellent growing conditions throughout the season. Harvest of the crop was under generally

ideal conditions with very little of the hay being spoiled from moisture when it was in the windrow. With all of the rosey outlook for crops, the pastures did not have sufficient moisture in many areas to accumulate much growth, but they did provide adequate grazing throughout the season.

The potato crops both in the East Slope and the San Luis Valley got a slow start due to early season cold temperatures. However, favorable weather plus adequate irrigation water during the rest of the growing season allowed the crop to develop fully. Freezing temperatures in late September caused limited damage in localized areas. Wet soils and cold temperatures which prevailed throughout most of the harvest season resulted in appreciable damage during digging. Skins did not set properly and many potatoes went into storage wet and dirty.

The broomcorn season started out fairly well, as many farmers were able to plant early and utilize the early summer rainfall. However, growers that were not able to plant before the rains encountered considerable trouble with winds and packed soils. Thus, a portion of the 1970 crop was not planted until the latter part of July. Colorado's brush obtained excellent length and the quality was quite good. Most acres were harvested, although the normal abandonment occurred. Some late planted fields did not mature and were not harvested for brush.

To sum up the 1970 crop year, farmers in Colorado experienced one of their best years in the past decade in output and quality of crops. Production of all crops in 1970 substantially exceeded the 1969 output. The index of all-crop production for 1970 amounted to 119 percent of the 1957-59 base, 15 points higher than in 1969. The index for winter wheat and rye production was 131 percent of base, 45 points higher than in 1969, while the index for feed grain production (corn, sorghum, oats and barley) at 136 percent was 18 points higher than a year earlier. The index of forage and hay production stood at 123 percent, 1 point above a year earlier.

COLORADO'S RANK IN AGRICULTURE AMONG THE STATES IN 1970

CROP OR LIVESTOCK ITEM	PRODUCTION OR NUMBER	RANK
Sheep on feed (1/1/71).....	480,000 head	1
Broomcorn.....	4,300 tons	2
Sugar Beets.....	2,416,000 tons	3
Dry Beans.....	1,992,000 cwt.	3
Lettuce.....	902,000 cwt.	3
All Sheep & Lambs (1/1/71).....	1,229,000 head	4

CROP AND LIVESTOCK INDEXES

Production indexes are used to combine production of the individual crop and livestock commodities to measure year-to-year changes in gross output. The period 1957-59 is used as the base period for this index. For each year the production of each commodity is multiplied by its 1957-59 average price to obtain a value for the base period. These values are totaled by groups and subgroups, then divided by the comparable 1957-59 average value to obtain the percent each year is of the base period. By using a constant per-unit value for each commodity throughout the series, changes in this percent (or index) reflect the actual changes in production of the commodities from year to year.

The **index of production of livestock and livestock products** measures the gross volume of livestock and livestock products, other than horses and mules produced during the year. Except for 1968 this index has shown a steady increase in production since 1957, primarily because of an increase in the production of meat animals in the State.

The **index of crop production** measures the gross volume of crops produced during the year regardless of eventual disposition or use. This index includes all crops of importance in Colorado. Food grains and feed grains are the primary components of the series and have a marked effect on the over-all crop index.

CROP AND LIVESTOCK PRODUCTION, COLORADO, 1937-1970

¹ Preliminary.

² Production and quantity sold figures are included in "All Potatoes."

³ Total stocks consist of "production less total disappearance to date."

Disappearance includes all sales for all purposes to date, all potatoes eaten or fed on farms where produced to date and all losses to date through shrinkage, decay, dumping, etc.

COLORADO WHEAT VARIETIES

For the second successive year, **Scout** was the most popular variety of winter wheat seeded in Colorado. The survey of winter wheat varieties planted in the fall of 1970 for harvest in 1971 indicated that Scout accounted for 39.4 percent of the total acreage planted. Scout's surge in popularity is attributed to its high yield, good milling and favorable agronomic characteristics. Acreage planted to Scout variety has been on the increase each year since 1965.

Wichita continues to decline in popularity, but was the second most popular variety of wheat seeded last fall. The percent of total acreage seeded to Wichita has declined from 56.3 percent in 1964 to 20.0 percent in the fall of 1970.

For the fourth consecutive year, **Warrior** was the third leading variety of winter wheat seeded in Colorado with 15.3 percent of the total planted acres. Warrior is gradually losing some of its acreage to the newer varieties as is the case with Wichita.

Trapper continued to increase in popularity and occupied fourth place with 7.3 percent of the total wheat acreage compared with 4.6 percent a year earlier. Trapper is a good yielding variety and has a high resistance to stem rust as well as high quality milling and baking characteristics.

Lancer was the fifth most popular variety of wheat planted last fall with 4.1 percent of the total acres planted. This variety has high yields and has shown stem rust resistance.

Satanta, a new variety, ranked sixth with 2.5 percent of acres planted. Satanta's popularity is credited to its high resistance to most common diseases, its comparability to Scout in yield, good milling quality and availability of seed.

Delmar moved from 11th to 8th in percentage of acres seeded in the State and accounted for 62.4 percent of the acres seeded in the Northwest district. Its popularity is related to its resistance to dwarf bunt, which is a common disease in northwest Colorado where most of the Delmar variety is grown.

The six most popular winter wheat varieties in Colorado plus Delmar in the Northwest accounted for 90.4 percent of the State's total winter wheat acreage planted for harvest in 1971.

1970 FRUIT CROP

Colorado fruit trees suffered little damage during the winter, and favorable early spring conditions held hopes for an excellent 1970 fruit crop. However, cool spring temperatures and severe freeze damage the second week in April reduced production potential. Light set was evident in most fruits but quality of the crops was not affected by insects or hail to any extent throughout the growing season.

Apple production for 1970 was estimated at 68.0 million pounds, 12 million pounds less than the 1969 crop. Apple orchards escaped severe freeze damage and set was near normal. The fruit matured slowly, however, and hard winds reduced expected volume. The leading variety produced in Colorado was Red Delicious with 39.1 percent of total production; second leading producer was Jonathan with 25.0 percent. Rome Beauty and Golden Delicious followed with 15.6 and 11.8 percent of total production, respectively.

Total **peach** production in 1970 was estimated at 24.0 million pounds compared with 39.5 million pounds in 1969. Heavy June drop was the result of late freeze damage to peaches. With the light set on the trees, the crop sized well, but near harvest, growers experienced further drop of the heavy fruit. Harvest was completed in mid-September. Production of peaches having value was estimated at 20.5 million pounds, compared with 32.8 million pounds in 1969.

Pear production was below 1969, but at a substantial output of 6,200 tons. Late freeze damage was limited in pear orchards, especially where smudging was practiced. However, the prolonged cool weather caused poor pollination and delayed full bloom by about one week. Throughout the growing season, the pear crop developed well, with little damage due to insects or hail. Harvest was completed in early September.

Tart cherry production was estimated at 1,350 tons for 1970, 13 percent below the 1969 crop. A number of trees in Larimer County were lost over the winter and there was spring frost damage to cherry trees in most major producing areas. Average full bloom date was about one day later than 1969. Excessive June drop reduced production below early expectations. Harvest was completed in early August.

Sweet cherry production for 1970 was estimated at 400 tons, compared with a 650-ton output in 1969. During April, severe frost damage was evident in scattered areas on the Western Slope. Poor pollination was caused by extended cool weather, which resulted in very light fruit set. Fruit drop was normal, but the early damage to the sweet cherries reduced the harvest, which was completed by the end of July.

COMMERCIAL VEGETABLES – 1970

Commercial vegetable production in Colorado during 1970 was down 3 percent from the 1969 level. This decrease can be attributed to a reduction in acreage planted to the various crops in 1970. Extreme cold weather and snow-covered fields during April hampered vegetable planting in the Arkansas Valley. Weather conditions throughout the growing season were generally favorable with the exception of a few local areas. Irrigation water supplies were generally adequate in all areas of the State during 1970.

Colorado's production of vegetables for fresh market accounted for 86 percent of the farm value derived from total vegetable production in 1970. Nationally, Colorado ranked 3rd in lettuce production, 5th in spinach production, 6th in cantaloupes, and 7th in dry onion production. Colorado ranked 9th among the major producing states in total production of vegetables for fresh market, and 17th in value of total commercial vegetable production.

A wide variety of commercial vegetables is raised by Colorado farmers in various parts of the State; however, each of the main producing areas has a few crops that typically account for most of the total farm value of commercial vegetables for that area. The leading crops in each area are: Northern Colorado—onions, carrots, sweet corn, and cabbage; San Luis Valley—lettuce, spinach, and carrots; Arkansas Valley—onions, cantaloupes, and tomatoes; Western Slope—onions and tomatoes.

The onion crop got off to a slow start as a result of cool temperatures and damage by wind. Warmer temperatures during June, coupled with an abundant water supply, helped to develop the crop. Below normal sizes contributed to a reduction in yields. In northern Colorado, wet weather caused some onions to go into storage with a high moisture content which resulted in above average cullage during the marketing season.

Colorado's 1970 lettuce crop made a late start due to an unseasonally cool spring. Early growth was retarded by cold weather and wind damage in the San Luis Valley. Although total harvested acreage was down 7 percent from 1969, favorable mid-season weather conditions resulted in a total production equal to the 1969 crop. Quality of the crop was generally very good.

Spinach production at 53,000 cwt. was 10 percent below the 1969 production of 59,000 cwt. Unseasonally warm weather in the San Luis Valley resulted in above average acreage abandonment. However, average yield was unchanged from a year earlier.

Cantaloupe production in 1970 totaled 228,000 cwt., 10 percent below the 252,000 cwt. produced in 1969. With total harvested acreage unchanged from the previous year, the decrease in production can be attributed entirely to lower yields attained for the 1970 crop. Continuous hot weather in the Arkansas Valley during harvest caused limited damage to a substantial portion of the acreage.

Carrot growers in Colorado produced 215,000 cwt., 12 percent less than the 1969 crop. The 1970 crop was harvested from 21 percent fewer acres than a year earlier. Generally favorable growing conditions resulted in above average yields of good quality carrots.

FARM INCOME AND PRICES

The realized net farm income to Colorado farmers and ranchers was \$153,400,000 in 1969. This was \$5,800,000 or 4 percent below 1968. However, after inventory adjustments, net income totaled \$192,000,000, up 8 percent from 1968. As might be expected, farm production expenses increased a staggering 16 percent from the previous year to a record \$969,700,000.

Cash receipts totaled \$1,078,600,000. This was up 13 percent from 1968. Government payments (including \$32,972,000 from the wheat program) came to \$66,492,000. Livestock and livestock products made up 79 percent of the total receipts excluding government payments. Cash receipts from livestock were at a record high of \$796,798,000, up 18 percent from the previous year. Total net income per farm in Colorado was \$4,948 in 1969. The U.S. average was \$5,654 per farm.

Preliminary estimates place cash receipts from farm marketings in 1970 at a record high \$1,181,517,000, up \$169,380,000 from 1969. This resulted from a substantial increase in the volume of marketings and from higher prices that farmers received for their products.

Livestock and livestock products receipts for 1970 totaled \$921,689,000 compared with \$796,798,000 in 1969. The number of livestock marketed was up considerably but prices received by farmers were near 1969 levels.

Crop receipts totaled \$259,828,000, up \$44,489,000 from 1969. Farmers were receiving better prices for both food and feed grains and marketings of these crops were up from a year earlier.

LIVESTOCK INVENTORY AND VALUE

The year 1970 was a year of growth for most Colorado livestock operations. The number of cattle and calves on Colorado farms and ranches on January 1, 1971 was at a record high and was 7 percent larger than the number on hand a year earlier. Hogs and pigs on farms totaled 352,000 on December 1, 1970, an increase of 30 percent from a year earlier. Turkey numbers on January 1, 1971 were up 11 percent from a year earlier and chickens were up 5 percent. In contrast, the sheep inventory continued at record low levels, declining 3 percent from the January 1, 1970 number. The total inventory value of all livestock and poultry on Colorado farms on January 1, 1971 was \$679 million compared with \$609 million a year earlier.

Adequate moisture in the spring and early summer of 1970 kept pastures and ranges in good condition. However, moisture became short in some localities in eastern Colorado in late summer. Although sugar beet harvest was delayed by wet weather, there were large amounts of feed for sheep and lambs in late fall.

Cash receipts to farmers and ranchers for all sales of cattle, calves, sheep, lambs, hogs, and pigs during 1970 amounted to \$837 million, 17 percent more than received in 1969. Higher prices were received in 1970 for cattle, calves, and sheep. Hog prices averaged about the same as in 1969 while lamb prices were lower.

Colorado continued its wide lead as the top ranking State in numbers of sheep and lambs on feed January 1, 1971. The State ranked fourth in the Nation in numbers of all sheep and lambs on farms and was eleventh in the number of all cattle and calves. Colorado ranked tenth in the number of beef cows, twenty-sixth in hog numbers, thirty-fourth in chickens, and sixteenth in the number of turkeys.

ALL CATTLE AND CALVES — Colorado's January 1, 1971 inventory of cattle and calves on farms was a record high of 3,516,000 head, 7 percent more than the record number on hand a year earlier. Within this total, milk cows was the only classification showing a decrease. The total inventory value of all cattle and calves on Colorado farms was \$633 million, an increase of 13 percent over January 1, 1970.

The classifications of cattle and calves were changed during 1970 from a sex and age to a sex and weight basis. See page 68 for a more complete designation of the various classes.

DAIRY CATTLE — Colorado milk cow numbers decreased slightly during 1970. The January 1, 1971 inventory of milk cows and heifers that had calved totaled 101,000 compared with 102,000 a year earlier. Production per cow averaged 8,752 pounds of milk

in 1970, 2 percent higher than the previous record set in 1969. Total milk production for 1970 was 884 million pounds, 14 million pounds more than produced a year earlier.

CATTLE ON FEED — There were 862,000 cattle and calves on feed for slaughter market in Colorado feedlots on January 1, 1971 compared with 795,000 on feed a year earlier. This number is included in the total January 1 inventory of cattle and calves. Marketings of fed cattle from Colorado feedlots during 1970 totaled 1,915,000 head, 9 percent more than marketed during 1969.

Steers accounted for 64 percent of the total cattle and calves on feed on January 1, 1971 and heifers made up 35 percent. A year earlier, steers accounted for 58 percent and heifers 41 percent of the January 1 number on feed. Cows and bulls accounted for the remaining 1 percent each year.

Number on feed on January 1, 1971 were up from the previous year in all areas of the State. The 18,900 head on feed in the Western district was more than double the number on feed a year earlier. The Northeast district, which had 70 percent of the total cattle on feed on January 1, 1971, was up 7 percent. The trend toward fewer but larger feedlots continued in 1970. Feedlots with a capacity of 1,000 head and over increased by more than 50 percent while feedlots maintaining a capacity below 1,000 head decreased 17 percent. The large feedlots accounted for 86 percent of the January 1, 1971 total number on feed.

CALF CROP — Colorado produced 1,116,000 calves during 1970, 5 percent above the record 1969 calf crop of 1,061,000. The larger calf crop in 1970 resulted from a larger number of cows and heifers two years old and older on farms January 1, 1970 compared with a year earlier. Calves born, as a percentage of cows and heifers that had calved on hand the first of the year, was 96 percent. Figured as a percent of cows two years old and older on farms January 1, 1970, the calf crop was 93 percent, 3 points lower than in 1969.

SHEEP AND LAMBS — Sheep numbers continued to decline during 1970 and on January 1, 1971 totaled 1,229,000. This was the lowest number of record which dates back to 1920. Included in the total were 749,000 stock sheep, 9 percent less than a year earlier and also the lowest number on record. Value of the stock sheep on January 1, 1971 was \$22 million, down 11 percent from a year earlier.

LAMB CROP — Conditions in 1970 were generally favorable for lambing in Colorado, but the State's 717,000 head lamb crop was the smallest since 1925. This was 3 percent less than in 1969 and 6 percent smaller than in 1968. The smaller lamb crop resulted from a smaller number of breeding ewes on farms.

SHEEP AND LAMBS ON FEED—Feed was more limited than usual early in 1970 because of unfavorable crop conditions late in 1969. Fall and winter feed supplies (sugar beet tops, corn and sorghum residues) were plentiful and maintained large numbers of sheep in good condition. Sheep and lambs on feed for slaughter in Colorado feedlots on January 1, 1970, totaled 440,000 head, 9 percent less than a year earlier. On March 1, 1970, there were 365,000 head on feed, 19 percent more than on March 1, 1969. The number on feed slackens off during spring and summer months and picks up again in the fall. There were 550,000 head on feed November 1, 1970, 24 percent more than a year earlier and 480,000 head on feed January 1, 1971, 9 percent more than a year earlier.

WOOL PRODUCTION — Colorado's 1970 output of wool amounted to 9,893,000 pounds, 2 percent less than a year earlier. Sheep and lambs shorn numbered 1,120,000, down 1 percent from the previous year. Fleece weights from all sheep and lambs shorn averaged 8.8 pounds per head, as compared with 8.9 pounds per head in 1969.

HOGS AND PIGS—There were 352,000 hogs and pigs on Colorado farms December 1, 1970, 30 percent more than a year earlier. Total inventory value is estimated at \$8,272,000, 9 percent less than the value a year earlier. Average value per head at \$23.50 on December 1, 1970 was significantly below the \$33.40 value a year earlier and lower than the \$27.00 value in 1968. Pigs born December 1969-May 1970 totaled 257,000, exceeding the same period in 1969 by 18 percent. In the months of June-November 1970, there were 300,000 pigs born in Colorado, 25 percent more than during the same period a year earlier.

CHICKENS AND EGGS—Chicken inventory on Colorado farms January 1, 1971 totaled 2,052,000, 5 percent more than a year earlier. Hens and pullets of laying age numbered 1,606,000, 4 percent more than on hand a year earlier. Pullets which were not yet of laying age numbered 423,000, 8 percent more than the previous January 1. Output of eggs for 1970 totaled 335 million, 5 percent more than the number of eggs produced in 1969.

TURKEYS — Turkeys on hand January 1, 1971 totaled 83,000, 11 percent more than a year earlier. Of this total, there were 65,000 heavy breeder hens, a 35 percent increase over the previous year. During 1970, Colorado growers raised a total of 2,856,000 turkeys, 17 percent more than during 1969. Gross income from turkeys sold during 1970 amounted to \$12,693,000, an increase of 5 percent from 1969.

CATTLE AND CALVES ON FARMS JANUARY 1 --- COLORADO, 1950-1971

1/ For 1950-1970 includes all heifer calves kept for milk replacement purposes. After 1970 does not include heifers under 500 pounds that may be used for milk.
 2/ For 1950-1970 includes beef calves only. After 1970 includes all calves under 500 pounds kept for beef, dairy and other purposes.

SHEEP AND LAMBS ON FARMS JANUARY 1, 1950-1971
