June 5, 1979

Dear Friend:

We are pleased to present the 1979 volume of Colorado Agricultural Statistics. This publication provides a continuous record of our state's agriculture and its contribution to the economy.

This issue contains revised county data for the years 1971 through 1977, as well as the preliminary figures for 1978.

The year 1978 was one of contrasts. It saw prices in the livestock industry finally reverse themselves and move rapidly up to profitable levels. Grain prices, meanwhile, remained stalemated below cost of production.

As our state's agricultural industry experiences periods of adversity, such as we saw in the mid 1970's, it becomes apparent that producers in particular need to use every possible economic tool if they are to survive. Dependable statistics are among the most vital of such tools and are virtually indispensable in helping bankers, agri-business, legislators, farm organizations, and government agencies, as well as farmers and ranchers, plan for the future.

The willing participation of members of our agricultural community in the surveys that underlie this publication is greatly appreciated. Comments or suggestions for improvement will be welcome.

Sincerely,

  
Morgan Smith  
Commissioner

## TABLE OF CONTENTS

|                                                            |     |
|------------------------------------------------------------|-----|
| Colorado's rank in agriculture .....                       | 2   |

### Rank in agriculture: Colorado's rank among states, 1978

| Crop or livestock item           | Production or number | Unit    | Rank |
|----------------------------------|----------------------|---------|------|
| Sheep on feed <sup>1</sup>       | 320,000              | Number  | 1    |
| All sheep & lambs <sup>1</sup>   | 795,000              | Number  | 4    |
| Spinach                          | 63,000               | Cwt.    | 4    |
| Wool                             | 7,689,000            | Pounds  | 4    |
| Cattle on feed <sup>1</sup>      | 1,080,000            | Number  | 5    |
| Dry beans                        | 1,530,000            | Cwt.    | 5    |
| Lettuce                          | 1,161,000            | Cwt.    | 5    |
| Onions                           | 2,730,000            | Cwt.    | 5    |
| Winter wheat                     | 55,200,000           | Bushels | 6    |
| Cantaloups                       | 147,000              | Cwt.    | 7    |
| Sugar beets                      | 1,538,000            | Tons    | 7    |
| Barley                           | 15,360,000           | Bushels | 8    |
| Corn silage                      | 4,522,000            | Tons    | 9    |
| Pears                            | 1,700                | Tons    | 9    |
| All cattle & calves <sup>1</sup> | 3,090,000            | Number  | 10   |
| Cucumbers for pickles            | 17,500               | Tons    | 10   |
| Irish potatoes                   | 11,400,000           | Cwt.    | 10   |
| Sorghum grain                    | 9,300,000            | Bushels | 10   |
| Sorghum silage                   | 209,000              | Tons    | 10   |
| Alfalfa hay                      | 2,117,000            | Tons    | 15   |
| Corn grain                       | 79,200,000           | Bushels | 16   |
| All hay                          | 3,013,000            | Tons    | 20   |
| Apples                           | 45,000,000           | Pounds  | 22   |
| Peaches                          | 115,000              | Bushels | 26   |

<sup>1</sup>As of January 1, 1979.

## CROP AND LIVESTOCK INDEXES

Production indexes are used to measure year-to-year changes in the gross output and to compare the level of over-all production with a base period. The base year for the Colorado production indexes is 1967. For each year, the production for each commodity is multiplied by its 1967 average price to obtain a value. These values are totaled by subgroups and groups and then divided by the comparable 1967 value to obtain the percent each year is of the base period. By using a constant per-unit value for each commodity throughout the series, changes in the percent (or index) reflect the actual changes in production of the commodities from year to year.

The **index of production of livestock and livestock products** measures the gross volume of livestock and livestock products, excluding horses, produced during the year. The **index of crop production** measures the gross volume of crops produced during the year regardless of eventual disposition or use.

### Crop and livestock production: Index numbers, Colorado, 1960-78

(1967 = 100)

| Year | All farm productions | Livestock and livestock products |              |                |                | Crops     |             |     |              |             |            |       |
|------|----------------------|----------------------------------|--------------|----------------|----------------|-----------|-------------|-----|--------------|-------------|------------|-------|
|      |                      | All lvt products                 | Meat animals | Dairy products | Poultry & eggs | All crops | Feed grains | Hay | Hay & silage | Food grains | Vegetables | Fruit |

## 1978 CROP REVIEW

The 1978 index of all crop production, at 137 percent of the 1967 base period, was 5 points above a year earlier with all sub-group indices except food grain and fruit contributing to the increase. The food grain index was unchanged from the previous year but the fruit index was 52 percent lower as a result of late spring freezes. The feed grain index set a new record high for the fourth consecutive year but the increase was limited somewhat by a slightly smaller corn crop as the output of barley, oats, and sorghum was above 1977 for each crop. More hay was harvested in 1978 than was cut during the 1977 drought. The output of most vegetable crops was also higher than a year earlier, resulting in a 20 percent increase in the vegetable production index.

Seeding of winter wheat for harvest in 1978 finished ahead of normal in mid-October and plants entered the winter season in good condition. Normal to above-average snowfall provided adequate moisture and protection from blowing winds until early spring when drier conditions put some stress on the crop for several weeks. In late April, general rains fell over the state which helped to abate the moisture problem. However, the accompanying cool weather delayed crop development into late June and early July when unseasonably warm temperatures caused rapid maturation of the winter wheat crop and some shriveling of grain. Scattered hail storms during June also caused their usual amount of damage. Harvest activities were completed in eastern Colorado by the end of July but continued through August on the Western Slope. No serious problems were reported during harvest and yields averaged a bushel higher than a year earlier.

Field preparation and seeding of spring grains progressed at a near normal pace during March and most of April and was generally completed by the usual times. Seeding of late-season crops was delayed by the April rainfall. Crops such as corn and sorghum were behind schedule in development during most of the growing season, mostly as a result of the late start but also because of cool nighttime temperatures. Extremely hot weather after mid-July tended to advance all crops to maturity faster than normal. The ample stream flow from the winter snowpack proved to be badly needed as the weeks wore on with virtually no rainfall, particularly across the southern half of the state. Around-the-clock irrigating became necessary and reservoir levels dropped rapidly. Dryland crops such as the dry bean acreage in southwestern Colorado suffered significantly. Harvest of spring grains was active throughout August and was nearing completion by the first week of September. Late summer and fall weather conditions were excellent for final maturation and harvest of all late season crops.

Seeding of the 1979 winter wheat crop was slowed in many areas by a lack of sufficient soil moisture. In other localities, producers were able to begin planting just after scattered rain showers fell in early September. Wheat fields in east central Colorado got off to a particularly good start but seed germination was hampered by the lack of moisture in the southeast, northeast, and along the Front Range. Most producers had finished seeding by the end of October although some of the acreage was reseeded in mid-November. While snow cover across the eastern plains was more abundant during the winter, temperatures were unseasonably cold during December and January. In the extreme northeast, particularly, emerged plants had not developed the necessary root structure for protection and winterkill was quite severe. Heavy spring snows and rain improved soil moisture supplies to the best level in several years. While the moisture delayed seeding of spring grains and row crops, it should be of benefit to crops later in the growing season.

<sup>1</sup>Preliminary.

## FRUIT CROPS — 1978

Fruit production in Colorado during 1978 totaled 27,740 tons, virtually one-half as much as was produced in 1977 and 47 percent below the 1976 output. The production of each fruit was sharply below a year earlier as several spring freezes destroyed blooms or early sets of all fruit crops. Irrigation water supplies were adequate in all areas during the growing season. With the smaller crops, producers received a higher price per unit of each fruit. However, the reduced output was more than offsetting as the total value of the 1978 fruit crop was 43 percent below 1977 and 40 percent below the value of the 1976 crop. The 1978 crop was valued at \$6.26 million compared with the 1976 and 1977 crops which had a value of \$10.46 million and \$10.91 million, respectively.

**Apples** continued to be the leading fruit crop produced in Colorado. The 1978 output totaled 45.0 million pounds, down 30 million pounds or 40 percent from a year earlier. The crop was sharply reduced by the spring freezes and at harvest time approximately 4.0 million pounds were not harvested because of an early fall freeze and inadequate labor. Apples accounted for 81 percent of the total fruit produced in Colorado during 1978.

Jonathan replaced Red Delicious as the leading variety of apples produced in the state and Rome Beauty ranked second. These two varieties were not as seriously affected by the spring freezes as was the output of Red Delicious. Jonathan accounted for 27 percent of the total crop; Rome Beauty, 26 percent; and Red Delicious, 24 percent. Golden Delicious was the fourth most important variety, representing 20 percent of the total apple production in 1978.

Apple producers received an average of 10.4 cents per pound for their 1978 crop, up from 9.3 cents a year earlier. The total value of the 41.0 million pounds utilized was \$4.26 million, 39 percent below the \$6.98 million received from the 1977 crop and 33 percent below the value of the 1976 crop.

**Peach** production for 1978 totaled only 5.5 million pounds, down 69 percent from a year earlier. Quality of the 1978 crop was good but production was severely reduced by the spring freezes. With the small crop, producers received a higher average price than a year earlier. However, the 17.6 cents per pound was not enough to offset the lower output as the value of the 1978 crop, at \$968,000, was 51 percent below the \$1.99 million crop produced in 1977 and 59 percent below the 1976 crop which was valued at \$2.35 million.

**Pear** production for 1978 was 1,700 tons compared with crops of 6,900 tons in 1977 and 6,400 tons in 1976. Pears were not a good crop in 1978 as the spring freezes sharply reduced the potential output, and quality of the remaining fruit was so poor that a high percentage of the crop was diverted to processing. Although producers received a higher average price for their pears in 1978, the total value of this year's crop was only one-third that of a year earlier and was 57 percent below the value of the 1976 output.

**Tart cherry** production was also sharply reduced by the spring freezes and totaled only 1.3 million pounds for 1978, down 43 percent from the previous year and 61 percent below the 1976 crop. The average price received per pound, at 41.6 cents, was 71 percent above the 1977 average and was more than double the 1976 value per unit. The increased price nearly offset the lower production as the total value of the 1978 crop, at \$541,000, was only 3 percent below the value of the 1977 crop. The 1976 crop had a value of \$653,000.

**Sweet cherry** production for 1978 was nearly wiped out by the spring freezes as the 140 tons produced was 75 percent below the previous year and 72 percent below two years earlier. Growers received an average price of \$1,067 per ton for the 1978 crop, up sharply from the 1977 average price of \$680 per ton. The total value of the crop in 1978 was \$149,000 compared with \$374,000 in 1977 and \$298,000 for the 1976 crop.

## COMMERCIAL VEGETABLES — 1978

Colorado's commercial vegetable production during 1978 was 20 percent above the previous year, mostly as a result of more acreage but also from improved yields per acre. Vegetable growers harvested 287,950 tons of produce from 25,340 acres in 1978 compared with 240,000 tons from 22,770 acres in 1977. Average prices received per unit of product were above a year earlier for many commodities. As a result, value of sales totaled \$34,102,000 in 1978 and was up 32 percent from the \$25,886,000 received a year earlier.

**Onions** continued to be the largest vegetable crop produced in Colorado in terms of acreage harvested, tonnage produced, and value of sales. For 1978, the 7,800 acres of storage type onions harvested represented an increase of 15 percent from the previous year. Total production was 34 percent greater than a year earlier as yields per acre averaged nearly 17 percent above 1977. With an average yield of 350 hundredweight per acre, the total output in 1978 was 2,730,000 cwt. However, average prices for the 1978 crop were expected to be only slightly above a year earlier. The average return was expected to be \$6.06 per cwt. compared with \$5.53 in 1977 and \$8.35 in 1976. The 1978 onion crop was valued at \$14.1 million, 61 percent above the value of the 1977 crop.

**Lettuce** maintained its position as the second largest vegetable crop produced in Colorado, even though there were some significant changes in acreage and production. The 5,400 acres harvested were 26 percent above the previous year, per acre yields averaged 9 percent lower, and total production of 1,161,000 cwt. was up 15 percent from 1977. Grower prices averaged \$4.99 per cwt. in 1978, well below the \$5.89 per cwt. received for the 1977 crop. Total value of sales, at nearly \$5.8 million, was slightly below the \$6 million received the previous year.

**Sweet Corn** data for 1978 did not change much from a year earlier but the crop ranked third in terms of acreage harvested. The 3,200 acres harvested were down 100 acres from the previous year. Per acre yields were slightly higher, resulting in a 2 percent increase in total production. Growers received an average price of \$6.98 per cwt. in 1978 compared with \$7.31 a year earlier. Value of sales totaled \$2.2 million, 3 percent below 1977.

**Cabbage** growers harvested 200 more acres in 1978 than they did in 1977 but per acre yields averaged lower, resulting in a 2 percent decrease in total production. Grower prices averaged much higher than a year earlier which more than offset the reduced output. Value of sales, at \$3,210,000, was 66 percent above 1977.

**Carrots** were harvested from the same number of acres as in 1977 but yields were higher, resulting in a 14 percent increase in total production. Growers also received a slightly better price in 1978 for their product which raised the value of sales to \$2,488,000, 37 percent above the previous year.

**Cucumbers for pickles** were harvested from 600 more acres than a year earlier but lower per acre yields were nearly offsetting as total output was only 1 percent above 1977. Producers received \$131.00 per ton in 1978 compared with \$108.00 a year earlier. The higher price resulted in a 23 percent increase in value of sales to \$2,293,000 for 1978.

**Cantaloup** production was 28 percent above a year earlier as a result of increased harvested acres and higher yields. Grower prices were also higher and the total value of sales rose to \$759,000, 47 percent above 1977. **Snap beans for processing** were lower in every category except price per unit sold which increased 2 percent. Value of sales for 1978 was 29 percent below a year earlier.

**Spinach** production was up 5 percent as higher per acre yields offset a slight decline in harvested acreage. The 1978 crop was valued at \$1,814,000 compared with \$1,356,000 for the 1977 crop. **Processing tomato sales** were valued at \$731,000, up 64 percent from 1977. **Green peas for processing** were below a year earlier in every category except yield per acre. Value of sales, at \$122,000, was 18 percent below the previous year.

<sup>1</sup>Quantity in pounds, retail weight unless otherwise shown. Data on calendar year basis except for dried fruits, fresh citrus fruits, peanuts, and rice which are on a crop-year basis.

<sup>2</sup>Preliminary.

<sup>3</sup>Commercial production for sale as fresh produce.

<sup>4</sup>Including fresh equivalent of processed.

<sup>5</sup>White, whole wheat, and soft red winter wheat including use in bakery products.

Note: Reprinted from **National Food Review**, December 1978, USDA-ESCS.

## PRICES RECEIVED BY FARMERS

Price data are collected to provide a basis for measuring the economic well-being of producers, both in terms of the per unit value of crops and livestock and the total value of production of crops and livestock. These data are extensively used, not only for analyzing past occurrences but also for keeping abreast of the marketing situation to make current and future marketing decisions.

Price statistics, particularly for major crops, have become increasingly important because of their use in calculating deficiency payments. By law, eligible producers receive deficiency payments when both the national average market price, during the first 5 months of the marketing year, and the national loan rate are below the target price.

Price data are also important in "triggering" the movement of commodities out of the USDA Reserve Programs. If the national average market price exceeds the national loan rate by a certain percentage, which varies by crop, producers "may" redeem their crop from the program at their option. If the national average market price exceeds the loan value by an even higher pre-set percentage, producers "must" liquidate the loan by either repayment or forfeiture of the commodity.

The basic data used to determine prices received are provided voluntarily by producers, grain elevators, and others who purchase agricultural products. In addition, cattle prices are based on recorded direct and auction sales under a cooperative program with the Livestock Market News Branch of the Agricultural Marketing Service. Other surveys measure the disposition of crops and the amount of the crop that is sold during each month of the marketing year. These monthly marketing volumes are then used to weight the previously estimated monthly prices to determine the season average price. As with crops, marketing volumes of livestock are also determined and are used to weight monthly livestock prices to calculate the season average price. Monthly and season average prices reflect all sizes and grades of each commodity sold where appropriate. Season average prices are based upon the marketing year for each commodity and may or may not correspond to a calendar year average price.

### Prices received by farmers: Season average prices, by commodities, Colorado, 1970-78

## **COLORADO INDEX OF PRICES RECEIVED BY FARMERS AND RANCHERS**

Index numbers have been commonly accepted as a convenient method for combining prices of various commodities to measure the trend and level of prices compared with a reference point or base period, which is 1966-68 for the Colorado index. Prices during the base period are set equal to 100 so that previous or subsequent price levels can be easily expressed as a percentage of prices during the base period. The index provides a composite measure of the average change in prices of agricultural products from month to month and from year to year.

### **Commodities Used In The Colorado Index**

Commodities are grouped into nine groups and these are then combined into the two major groups — (1) Crops and (2) Livestock. A separate index is computed for each commodity group. Commodities included in each group are as follows:

#### **Crops**

Food grains: Wheat  
 Feed grains and hay: Barley, corn, sorghum grain and hay (all)  
 Vegetables: Potatoes, lettuce, onions, carrots, cucumbers and cabbage  
 Fruit: Apples for fresh use and peaches for fresh use  
 Other crops: Sugar beets and dry beans

#### **Livestock**

Meat animals: Cattle, calves, hogs and lambs  
 Poultry and eggs: Eggs and turkeys  
 Dairy products: Milk (wholesale)  
 Wool: Wool

### **Computation Of The Index**

The index for each commodity group is the summation of the current price times the base quantity for each item within the group divided by the summation of the base price times the base quantity for the same items. After the commodity group index numbers are computed, the two major group indexes, crops and livestock, are computed by combining the commodity group index numbers. This is done by weighting each commodity group index by a percent representing its relative importance in the major group. By using percentage weights the value of minor commodities not included in index computations may be imputed to the group to which it should belong.

The All Farm Products Index is derived by weighting the Crop Index and the Livestock Index based on the percent of cash receipts from each major group during the weight base period. During 1966-68 crops made up an average of 24.1 percent of cash receipts while livestock accounted for 75.9 percent. These weights or percentages are applied to the respective major group index numbers to obtain the All Farm Products Index for a given month.

### **Adjustment for Short-Season Crops**

For the prices received index to be comparable from one month to the next the same items must be included in it for all months. Since price estimates are not made during months in which a commodity is not marketed, adjustments in the index are needed. Vegetables and fruit are seasonal commodities for which prices are not available in all months. As a general rule, if there are no sales for three months or less, the last monthly price is carried forward so that the commodity causes no change in the index during these months. When the period of no sales exceeds three months, the season average price for the crop just marketed is used during the period of no sales. This sometimes causes a slight shift in the level of the index in the first month the season average is used but does represent the correct level of prices for the individual commodity.

### **Revisions**

For some commodities, additional price data become available after current price estimates are prepared. When prices for index commodities are revised, the prices received index is also revised.

## Prices received: Commodity group index numbers, by months, Colorado, 1960-78

(1966-68 = 100)

| Year                     | Jan. | Feb. | Mar. | Apr. | May | June | July | Aug. | Sept. | Oct. | Nov. | Dec. | Annual average |

## COLORADO FARM INCOME

**1977** - Realized net farm income for Colorado farmers and ranchers totaled \$189.8 million during 1977, down 37 percent from the previous year and 58 percent below two years earlier. After inventory adjustments, net farm income totaled \$195.2 million, 24 percent below 1976 and 58 percent below 1975. Farm production expenses increased 13 percent from a year earlier to a record high \$2,075.9 million for 1977.

Cash receipts from marketings of farm products, including government payments, totaled just over \$2.1 billion during 1977, up 5 percent from 1976 and 10 percent above 1975. Government payments totaled \$65.4 million during 1977 compared with \$22.8 million in 1976. The increase results largely from major changes in the farm program and low farm prices for wheat and feed grains. Receipts from livestock and livestock products totaled nearly \$1.5 billion in 1977. This was 4 percent above a year earlier and represented 72.8 percent of the total receipts excluding government payments. Cash receipts from crops totaled \$561.2 million, up slightly from receipts of \$557.2 million during 1976.

In Colorado, the realized net farm income in 1977 for farm and ranch operators averaged just \$6,544 per farm, down 37 percent from \$10,341 a year earlier. The realized gross income per farm which averaged \$78,125 was up 7 percent from 1976 but farm production expenses increased 14 percent. After inventory adjustments, net farm income averaged \$6,730 per farm, down 23 percent from 1976.

**1978** - Preliminary estimates place cash receipts from farm marketings excluding government payments at \$2.4 billion, about 14 percent above 1977. Of this total, 79 percent or \$1.9 billion is expected to come from the sale of livestock and livestock products, up 27 percent from 1977. Receipts from crop sales is expected to total just over one-half billion dollars with not much change indicated from the previous year. Government payments, however, will add additional income. Sharply improved cattle prices during the last few months of 1978 are largely responsible for the increase in both livestock receipts and total cash receipts.

<sup>1</sup>Less than 0.05 percent.<sup>2</sup>Includes other minor animals and products.<sup>3</sup>Popcorn, mushrooms, seed crops, and other minor field crops.<sup>4</sup>Fresh market only.<sup>5</sup>Snap beans, green peas, and other minor vegetable crops.<sup>6</sup>Apricots, grapes, plums and prunes, berries, and other minor fruit crops.Note: Reprinted from **State Farm Income Statistics**, September 1978, USDA-ESCS.

## FARM LABOR

The data presented in this section are based upon probability agricultural labor surveys conducted quarterly in Colorado. The survey program has been on an operational basis since January of 1974 and provides the state estimates of its farm labor force. Data upon which the estimates are based are collected for those weeks that contain the 12th day of the month for the following months; January, April, July, and October. These surveys measure the farm labor of randomly selected farms which are then classified by hiring arrangements and type of work performed. The input for making the wage rate computations were supplied by employers of agriculture labor throughout Colorado as a part of the quarterly survey.

Farm employment: Number of workers, by quarters, Colorado, 1975-79<sup>1</sup>

## 1978 LIVESTOCK REVIEW

**SUMMARY** - Inventory numbers in Colorado were below a year earlier for all cattle and calves and for all sheep and lambs, while hogs and pigs showed an increase in numbers. The January 1, 1979 number of all cattle and calves decreased 3 percent from the previous year. Hog and pig numbers on December 1, 1978 were 3 percent above the previous year with both market hogs and breeding stock showing increases. Sheep and lamb numbers continued downward, dropping an additional 2 percent from January 1, 1978. The January 1, 1979 inventory of stock sheep and lambs was up 6 percent, the first increase in numbers since January 1, 1960. The December 1, 1978 count of chickens of all ages was 4 percent above the previous year.

Grazing conditions during the spring of 1978 showed very little improvement from the drought of 1977. Above normal temperatures and limited moisture in early spring further deteriorated the ranges and pastures. With above average moisture received in late May, conditions improved and were rated as generally good during June and early July except for the San Luis Valley which continued to suffer from the drought. Extremely hot and dry conditions prevailed during July causing the range and pasture feed supply to deteriorate through the end of the year. Above normal snowfall throughout the winter and spring rains have improved grazing prospects in all areas for the 1979 season.

**ALL CATTLE AND CALVES** - The inventory of all cattle and calves on Colorado farms and ranches totaled 3,090,000 as of January 1, 1979, down from 3,180,000 the previous year. **All cows** that had calved, at 915,000, were down 14,000 from January 1, 1978, representing the fifth consecutive decline from the January 1, 1974 high of 1,201,000. **Beef cows** totaled 843,000 and were down 2 percent while **milk cows** were unchanged at 72,000. **Heifers** weighing 500 pounds or more increased 1 percent to 739,000. Of this total 133,000 were being kept for **beef cow replacement** and 28,000 were intended for **milk cow replacement**. Of the 578,000 **other heifers** weighing 500 pounds or more, 80 percent were on feed for the slaughter market in Colorado feedlots. **Steers** weighing 500 pounds or more decreased 4 percent to 735,000 of which 81 percent were in Colorado feedlots. The number of **bulls** decreased 10 percent to 46,000. **Heifer, steer, and bull calves** weighing less than 500 pounds totaled 655,000, down 7 percent from 1978. The January 1, 1979 inventory value of all cattle and calves in Colorado totaled \$1.28 billion, 72 percent above the \$747.3 million inventory a year earlier. The increased value was due entirely to a record high value per head which more than offset the decreased inventory.

**DAIRY CATTLE** - The January 1, 1978 inventory of milk cows and heifers that had calved totaled 72,000, unchanged from the previous year but up 5 percent from 1977. Colorado's dairy herds averaged a record high 12,111 pounds of milk per cow in 1978. This was 167 pounds above the previous high of 11,944 pounds per cow a year earlier. Total milk production for 1978 totaled 872 million pounds, up 3 percent from 1977.

**CATTLE AND CALVES ON FEED** - There were 1,080,000 head of cattle and calves being fed for the slaughter market in Colorado feedlots as of January 1, 1979, up 6 percent from a year earlier. Northeast Colorado accounted for 67 percent of the January 1 total. During 1978, there were 2,455,000 fed cattle marketed from Colorado feedlots, up 7 percent from a year earlier. The 203 feedlots with a capacity of 1,000 head or more marketed 2,293,000 fed cattle, 93 percent of the state's total marketings. The remaining 162,000 were marketed from 217 lots with a capacity under 1,000 head.

**CALF CROP** - The 780,000 calves born on Colorado farms and ranches during 1978 was down 10 percent from the 865,000 head born during 1977 and was the smallest calf crop since 1959 which totaled 780,000.

**SHEEP AND LAMBS** - The downward trend in sheep numbers continued in Colorado as the January 1, 1979 inventory of all sheep and lambs was 2 percent below a year earlier. An 11 percent decline in the number of sheep and lambs on feed more than offset a 6 percent increase in stock sheep numbers, which were higher for the first time since January 1, 1960. The January 1, 1979 inventory of 795,000 included 475,000 **stock sheep** and lambs and 320,000 **sheep and lambs on feed**. The 1978 **lamb crop** of 429,000 was down 5 percent from the previous year. The value of all sheep and lambs on hand January 1, 1979 was \$62.8 million, 31 percent above the previous year and 46 percent above the 1977 inventory value.

**SHEEP AND LAMBS ON FEED** - Colorado farms and ranches accounted for 20 percent of the U. S. inventory of sheep and lambs on feed as of January 1, 1979, maintaining the state's position as the nation's leading sheep and lambs feeding state with 320,000 on feed. By March 1, 1979 the on-feed number had declined to 190,000 head, the smallest March 1 number on feed since estimates were started in 1961. On November 1, 1978, the first estimate for the 1978-79 feeding period, there were 460,000 sheep and lambs on feed in the state.

**WOOL PRODUCTION** - Colorado's 1978 wool crop was 7,689,000 pounds, down 13 percent from the 8,809,000 pounds produced in 1977. There were 1,007,000 head of sheep and lambs shorn during the year compared with 1,200,000 a year earlier. Fleece weights averaged 7.6 pounds in 1978 compared with 7.3 the previous year. Producers received an average of 73 cents per pound and the total value of the 1978 wool crop, at \$5,613,000, was 9 percent below the 1977 crop value of \$6,166,000.

**HOGS AND PIGS** - The December 1, 1978 inventory of all hogs and pigs in Colorado was 330,000 head, 3 percent above the 320,000 on hand a year earlier. **Market hogs** increased 2 percent to 280,000 and **breeding stock** increased 11 percent to 50,000. The December 1977 - May 1978 pig crop totaled 263,000, up 40,000 from a year earlier. During this period 37,000 sows farrowed and the average litter size was 7.1 pigs. For the June - November 1978 period, 38,000 sows farrowed with an average size of 7.0 pigs per litter for a total of 266,000 pigs. The December 1, 1978 inventory value of all hogs and pigs was \$23.9 million, 34 percent higher than a year earlier. Mostly as a result of a 29 percent increase in the average value per head.

**CHICKEN AND EGGS** - The December 1, 1978 inventory of 2,950,000 chickens of all ages was 4 percent above the previous year. The number of **hens and pullets of laying age** increased 2 percent to 2,360,000 and accounted for 80 percent of the total inventory. During the period December 1977 through November 1978 Colorado's laying flock produced 535 million eggs, 5 percent more than the 508 million produced in the comparable period a year earlier. The December 1, 1978 inventory value of all chickens was \$4,720,000, up 4 percent from the previous year.

**TURKEYS** - Colorado producers raised 3,580,000 turkeys during 1978, 2 percent more than the 3,500,000 raised during the previous year. The average price received for the 91.6 million pounds of turkey produced was 46 cents per pound and the gross income of \$42.2 million was up 11 percent from 1977.

**BEES AND HONEY** - Beekeepers extracted 2,613,000 pounds of honey from Colorado apiaries during 1978, 5 percent less than a year earlier. The number of colonies in all Colorado apiaries, at 39,000, was down 2,000 from last year. Average yield per colony was unchanged from last year's average of 67 pounds. Commercial beekeepers accounted for 74 percent of the colonies and 84 percent of the total honey. The 1978 honey crop was valued at \$1,458,000 compared with the \$1,437,000 crop produced in 1977. The average price per pound of honey sold in 1978 was 55.8 cents, up from 52.3 cents a year earlier.

**BEESWAX** - Colorado's beeswax production for 1978 totaled 55,000 pounds, unchanged from the previous year. Producers received an average of \$1.71 per pound for a total value of \$94,000 compared with the \$91,000 crop produced in 1977.

<sup>1</sup>Preliminary

<sup>2</sup>Combined with milk to avoid disclosure of individual operations.

<sup>3</sup>Cash receipts divided by milk or milkfat represented in combined marketings.

<sup>4</sup>Valued at average returns per 100 pounds of milk in combined marketings of milk and cream.

<sup>5</sup>Cash receipts from marketing of milk and cream plus value of milk used for home consumption and farmchurned butter.

- Production 172
- Value 172

## WHY CROP AND LIVESTOCK REPORTS

A man's judgment is no better than his facts, and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are the basis for analysis of agriculture and other business conditions.

They give producers the same foresight to future price trends that organized dealers possess.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
