

2010 CONEJOS COUNTY PROPERTY ASSESSMENT STUDY

September 15, 2010

Mr. Mike Mauer Director of Research Colorado Legislative Council Room 029, State Capitol Building Denver, Colorado 80203

RE: Final Report for the 2010 Colorado Property Assessment Study

Dear Mr. Mauer:

Wildrose Appraisal Inc.-Audit Division is pleased to submit the Final Reports for the 2010 Colorado Property Assessment Study.

These reports are the result of two analyses: A procedural audit and a statistical audit.

The procedural audit examines all classes of property. It specifically looks at how the assessor develops economic areas, confirms and qualifies sales, develops time adjustments and performs periodic physical property inspections. The audit reviews the procedures for determining subdivision absorption and subdivision discounting. Valuation methodology is examined for residential properties and commercial properties. Procedures are reviewed for producing mines, oil and gas leaseholds and lands producing, producing coal mines, producing earth and stone products, severed mineral interests, and non-producing patented mining claims.

Statistical audits are performed on vacant land, residential properties, commercial/industrial properties and agricultural land. A statistical analysis is performed for personal property compliance on the eleven largest counties: Adams, Arapahoe, Boulder, Denver, Douglas, El Paso, Jefferson, Larimer, Mesa, Pueblo and Weld. The remaining counties receive a personal property procedural study.

Wildrose Appraisal Inc. – Audit Division appreciates the opportunity to be of service to the State of Colorado. Please contact us with any questions or concerns.

Harry J. Fuller Project Manager

Harry J. Zulla

INTRODUCTION

The State Board of Equalization (SBOE) reviews assessments for conformance to the Constitution. The SBOE will order revaluations for counties whose valuations do not reflect the proper valuation period level of value.

The statutory basis for the audit is found in C.R.S. 39-1-104 (16)(a)(b) and (c).

The legislative council sets forth two criteria that are the focus of the audit group:

To determine whether each county assessor is applying correctly the constitutional and statutory provisions, compliance requirements of the State Board of Equalization, and the manuals published by the State Property Tax Administrator to arrive at the actual value of each class of property.

To determine if each assessor is applying correctly the provisions of law to the actual values when arriving at valuations for assessment of all locally valued properties subject to the property tax.

The property assessment audit conducts a twopart analysis: A procedural analysis and a statistical analysis. The procedural analysis includes all classes of property and specifically looks at how the assessor develops economic areas, confirms and qualifies sales, and develops time adjustments. The audit also examines the procedures for adequately discovering, classifying and valuing agricultural outbuildings, discovering subdivision build-out subdivision and Valuation discounting procedures. methodology for vacant land, improved residential properties commercial and properties is examined. Procedures for producing mines, oil and gas leaseholds and lands producing, producing coal mines, producing earth and stone products, severed mineral interests and non-producing patented mining claims are also reviewed.

Statistical analysis is performed on vacant land, residential properties, commercial industrial properties, agricultural land, and personal property. The statistical study results are compared with State Board of Equalization compliance requirements and the manuals published by the State Property Tax Administrator.

Wildrose Audit has completed the Property Assessment Study for 2010 and is pleased to report its findings for Conejos County in the following report.

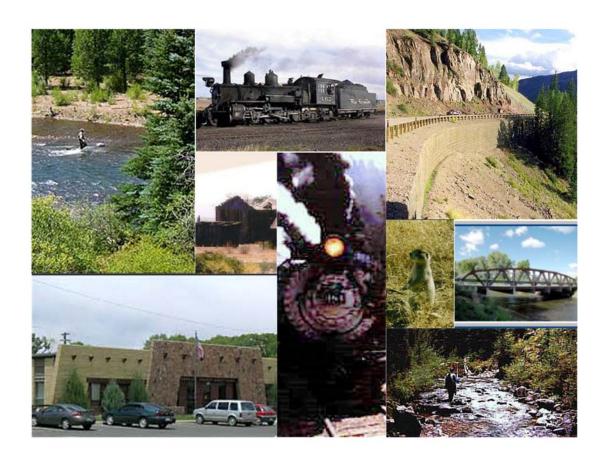

REGIONAL/HISTORICAL SKETCH OF CONEJOS COUNTY

Regional Information

Conejos County is located in the San Luis Valley region of Colorado. The San Luis Valley is a large, broad, alpine valley in the Rio Grande Basin of south-central Colorado. The valley is drained to the south by the Rio Grande

River which rises in the San Juan Mountains to the west of the valley. The San Luis Valley includes Alamosa, Conejos, Costilla, Mineral, Rio Grande, and Saguache counties.

Historical Information

Conejos County has a population of approximately 7,844 people with 6.5 people per square mile, according to the U.S. Census Bureau's 2009 estimated population data.

In the early 1800's, current day Conejos County was in the possession of Mexico. In 1848, the war between Mexico and the United States was settled with the signing of the Treaty of Guadalupe Hidalgo. After the United States victory, the Conejos Land Grant became the territory of the U.S. When the territory of Colorado was created in 1861, the major part of the San Luis Valley was divided into two counties, Costilla County to the east and Guadalupe County to the west. Once the Colorado Territory was established, Guadalupe County was quickly renamed Conejos County.

Conejos County was one of the original 17 counties created by the General Assembly of the Territory of Colorado on January 11, 1861. Its name came from the spanish term conejo, meaning rabbit, for the large abundance of rabbits in the area. Also early in its existence, the county seat was moved from the town of Guadalupe to Conejos.

In 1874, most of the western and northern portions of the county were broken away to form parts of Hinsdale, La Plata and Rio Grande counties, and Conejos County achieved its modern borders in 1885 when its western half was taken to create Archuleta County.

The town of Conejos boasts the oldest church in Colorado. Conejos County continues to be an ever-changing melting pot of cultures and perspectives. Although Guadalupe is considered the first established settlement (1851) in the county, other villages were being created at the same time. Guadalupe held the county seat until 1863 when its new neighbor, the town of Conejos, was established on the south side of the Conejos River.

Antonito, Spanish for "little Anthony," was first called San Antonio Junction. Founded by the Denver & Rio Grande Western (D&RGW) Railroad in 1880, Antonito is located in the south central part of Conejos County. When the railroad was extending south from Alamosa, company officials failed to get the desired concessions at the old town of Conejos, so they laid out a site of their own to the southeast of Conejos. Since that time, the town has been a shipping center for the southern end of the San Luis Valley and northern New Mexico. For many years, it was the junction for two branches of the railroad, one west over Cumbres Pass into the San Juan country and Durango, and the other into the ancient capital of Santa Fe, New Mexico. In the late 1930's, the southern branch was discontinued. Today, the San Luis and Rio Grande Railroad runs a freight train connecting perlite mine operations and lava rock to the north by hauling rail-cars loaded with these materials out of the area. The narrow gauge sections through the mountains are still in use as a historic tourist train. (Wikipedia.org & conejosvacation.com)

RATIO ANALYSIS

Methodology

All significant classes of properties were analyzed. Sales were collected for each property class over the appropriate sale period, which was typically defined as the 18-month period between January 2007 and June 2008. Counties with less than 30 sales typically extended the sale period back up to 5 years prior to June 30, 2008 in 6-month increments. If there were still fewer than 30 sales, supplemental appraisals were performed and treated as proxy sales. Residential sales for all counties using this method totaled at least 30 per county. For commercial sales, the total number analyzed was allowed, in some cases, to fall below 30. There were no sale quantity issues for counties requiring vacant land analysis or condominium analysis. Although it was required that we examine the median and coefficient of dispersion for all counties, we also calculated the weighted mean and pricerelated differential for each class of property. Counties were not passed or failed by these

latter measures, but were counseled if there were anomalies noted during our analysis. Qualified sales were based on the qualification code used by each county, which were typically coded as either "Q" or "C." The ratio analysis included all sales. The data was trimmed for counties with obvious outliers using IAAO standards for data analysis. In every case, we examined the loss in data from trimming to ensure that only true outliers were excluded. Any county with a significant portion of sales excluded by this trimming method was examined further. No county was allowed to pass the audit if more than 5% of the sales were "lost" because of trimming. For the largest 11 counties, the residential ratio statistics were broken down by economic area as well.

Conclusions

For this final analysis report, the minimum acceptable statistical standards allowed by the State Board of Equalization are:

ALLOWABL	RID	
Property Class	Unweighted Median Ratio	Coefficient of Dispersion
Commercial/Industrial	Between .95-1.05	Less than 20.99
Condominium	Between .95-1.05	Less than 15.99
Single Family	Between .95-1.05	Less than 15.99
Vacant Land	Between .95-1.05	Less than 20.99

The results for Conejos County are:

	Conejos County Ratio Grid						
Property Class	Number of Qualified Sales	Unweighted Median Ratio	Price Related Differential	Coefficient of Dispersion	Time Trend Analysis		
Commercial/Industrial	13	0.951	1.013	8.6	Compliant		
Condominium	N/A	N/A	N/A	N/A	N/A		
Single Family	56	0.979	1.028	11.1	Compliant		
Vacant Land	59	1.000	0.990	18	Compliant		

After applying the above described methodologies, it is concluded from the sales ratios that Conejos County is in compliance

with SBOE, DPT, and Colorado State Statute valuation guidelines.

Recommendations

None

Random Deed Analysis

An additional analysis was performed as part of the Ratio Analysis. Ten randomly selected deeds with documentary fees were obtained from the Clerk and Recorder. These deeds were for sales that occurred from January 1, 2007 through June 30, 2008. These sales were then checked for inclusion on the Assessor's qualified or unqualified database.

Conclusions

After comparing the list of randomly selected deeds with the Assessor's database, Conejos County has accurately transferred sales data from the recorded deeds to the qualified or unqualified database.

Recommendations

TIME TRENDING VERIFICATION

Methodology

While we recommend that counties use the inverted ratio regression analysis method to account for market (time) trending, some counties have used other IAAO-approved methods, such as the weighted monthly median approach. We are not auditing the methods used, but rather the results of the methods used. Given this range of methodologies used to account for market trending, we concluded that the best validation method was to examine the sale ratios for each class across the appropriate sale period. To be specific, if a county has considered and adjusted correctly for market trending, then the sale ratios should remain stable (i.e. flat) across the sale period. If a residual market trend is detected, then the county may or may not have addressed market

trending adequately, and a further examination is warranted. This validation methodology also considers the number of sales and the length of the sale period. Counties with few sales across the sale period were carefully examined to determine if the statistical results were valid.

Conclusions

After verification and analysis, it has been determined that Conejos County has complied with the statutory requirements to analyze the effects of time on value in their county. Conejos County has also satisfactorily applied the results of their time trending analysis to arrive at the time adjusted sales price (TASP).

Recommendations

SOLD/UNSOLD ANALYSIS

Methodology

Conejos County was tested for the equal treatment of sold and unsold properties to ensure that "sales chasing" has not occurred. The auditors employed a multi-step process to determine if sold and unsold properties were valued in a consistent manner.

All qualified residential and commercial class properties were examined using the unit value method, where the actual value per square foot was compared between sold and unsold properties. A class was considered qualified if it met the criteria for the ratio analysis. The median value per square foot for both groups was compared from an appraisal and statistical perspective. If no significant difference was indicated, then we concluded that no further testing was warranted and that the county was in compliance in terms of sold/unsold consistency.

If either residential or commercial differences were significant using the unit value method, or if data limitations made the comparison invalid, then the next step was to perform a ratio analysis comparing the 2009 and 2010 actual values for each qualified class of property. All qualified vacant land classes were tested using this method. The sale property ratios were arrayed using a range of 0.8 to 1.5, which theoretically excluded changes between years that were due to other unrelated changes in the property. These ratios were also stratified at the appropriate level of analysis. percent change was determined for each appropriate class and sub-class, the next step was to select the unsold sample. This sample

was at least 1% of the total population of unsold properties and excluded any sale properties. The unsold sample was filtered based on the attributes of the sold dataset to closely correlate both groups. The ratio analysis was then performed on the unsold properties and stratified. The median and mean ratio distribution was then compared between the sold and unsold group. A nonparametric test such as the Mann-Whitney test for differences between independent samples was undertaken to determine whether any observed differential was significant. If this test determined that the unsold properties were treated in a manner similar to the sold properties, it was concluded that no further testing was warranted and that the county was in compliance.

If a class or sub-class of property was determined to be significantly different by this method, the final step was to perform a multivariate mass appraisal model that developed ratio statistics from the sold properties that were then applied to the unsold sample. This test compared the measures of central tendency and confidence intervals for the sold properties with the unsold property sample. If this comparison was also determined to be significantly different, then the conclusion was that the county had treated the unsold properties in a different manner than sold properties.

These tests were supported by both tabular and chart presentations, along with saved sold and unsold sample files.

Sold/Unsold R	esults
Property Class	Results
Commercial/Industrial	Compliant
Condominium	N/A
Single Family	Compliant
Vacant Land	Compliant

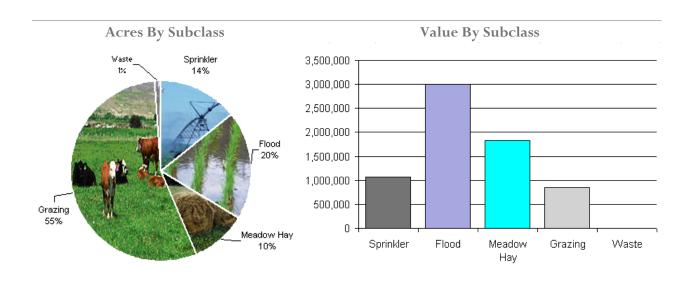

Conclusions

After applying the above described methodologies, it is concluded that Conejos County is reasonably treating its sold and unsold properties in the same manner.

Recommendations

AGRICULTURAL LAND STUDY

Agricultural Land

County records were reviewed to determine major land categories such as irrigated farm, dry farm, meadow hay, grazing and other In addition, county records were reviewed in order to determine if: Aerial photographs are available and are being used; soil conservation guidelines have been used to classify lands based on productivity; crop rotations have been documented; typical commodities and yields have been determined; orchard lands have been properly classified and valued; expenses reflect a ten year average and are typical landlord expenses; grazing lands have been properly classified and valued; the number of acres in each class and subclass have been determined; the capitalization rate was properly applied. Also, documentation was required for the valuation methods used and locally developed yields, carrying capacities, and expenses. Records were also checked to ensure that the commodity prices and expenses, furnished by the Property Tax Administrator (PTA), were applied properly.

(See Assessor Reference Library Volume 3 Chapter 5.)

Conclusions

An analysis of the agricultural land data indicates an acceptable appraisal of this property type. Directives, commodity prices and expenses provided by the PTA were properly applied. County yields compared favorably to those published by Colorado Agricultural Statistics. Expenses used by the county were allowable expenses and were in an acceptable range. Grazing lands carrying capacities were in an acceptable range. The data analyzed resulted in the following ratios:

	Conejos County Agricultural Land Ratio Grid						
Abstract Code	Land Class	Number Of Acres	County Value Per Acre	County Assessed Total Value	WRA Total Value	Ratio	
4107	Sprinkler	32,073	33.33	1,069,079	1,022,016	1.05	
4117	Flood	44,833	67.04	3,005,711	2,905,493	1.03	
4137	Meadow Hay	22,618	80.94	1,830,695	1,830,695	1.00	
4147	Grazing	126,375	6.74	852,188	852,188	1.00	
4167	Waste	2,505	1.62	4,046	4,046	1.00	
Total/Avg		228,404	29.60	6,761,718	6,614,437	1.02	

Recommendations

Agricultural Outbuildings

Methodology

Data was collected and reviewed to determine if the guidelines found in the Assessor's Reference Library (ARL) Volume 3, pages 5.74 through 5.77 were being followed.

Conclusions

Conejos County has substantially complied with the procedures provided by the Division of Property Taxation for the valuation of agricultural outbuildings.

Recommendations

SALES VERIFICATION

According to Colorado Revised Statutes:

A representative body of sales is required when considering the market approach to appraisal.

(8) In any case in which sales prices of comparable properties within any class or subclass are utilized when considering the market approach to appraisal in the determination of actual value of any taxable property, the following limitations and conditions shall apply:

(a)(I) Use of the market approach shall require a representative body of sales, including sales by a lender or government, sufficient to set a pattern, and appraisals shall reflect due consideration of the degree of comparability of sales, including the extent of similarities and dissimilarities among properties that are compared for assessment purposes. In order to obtain a reasonable sample and to reduce sudden price changes or fluctuations, all sales shall be included in the sample that reasonably reflect a true or typical sales price during the period specified in section 39-1-104 (10.2). Sales of personal property exempt pursuant to the provisions of sections 39-3-102, 39-3-103, and 39-3-119 to 39-3-122 shall not be included in any such sample.

(b) Each such sale included in the sample shall be coded to indicate a typical, negotiated sale, as screened and verified by the assessor. (39-1-103, C.R.S.)

The assessor is required to use sales of real property only in the valuation process.

(8)(f) Such true and typical sales shall include only those sales which have been determined on an individual basis to reflect the selling price of the real property only or which have been adjusted on an individual basis to reflect the selling price of the real property only. (39-1-103, C.R.S.)

Part of the Property Assessment Study is the sales verification analysis. WRA has used the above-cited statutes as a guide in our study of the county's procedures and practices for verifying sales.

WRA reviewed the sales verification procedures in 2010 for Conejos County. This study was conducted by checking selected sales from the master sales list for the Jan 1, 2007 - June 30, 2008 valuation period. Specifically WRA selected 32 sales listed as unqualified.

All of the sales in the unqualified sales sample had reasons that were clear and supportable.

Conclusions

Conejos County appears to be doing an excellent job of verifying their sales. WRA agreed with the county's reason for disqualifying each of the sales selected in the sample. There are no recommendations or suggestions.

Recommendations

EVALUATION EVALUATION

Methodology

Conejos County has submitted a written narrative describing the economic areas that make up the county's market areas. Conejos County has also submitted a map illustrating these areas. Each of these narratives have been read and analyzed for logic and appraisal sensibility. The maps were also compared to the narrative for consistency between the written description and the map.

Conclusions

After review and analysis, it has been determined that Conejos County has

adequately identified homogeneous economic areas comprised of smaller neighborhoods. Each economic area defined is equally subject to a set of economic forces that impact the value of the properties within that geographic area and this has been adequately addressed. Each economic area defined adequately delineates an area that will give "similar values for similar properties in similar areas."

Recommendations

NATURAL RESOURCES

Earth and Stone Products

Methodology

Under the guidelines of the Assessor's Reference Library (ARL), Volume 3, Natural Resource Valuation Procedures, the income approach was applied to determine value for production of earth and stone products. The number of tons was multiplied by an economic royalty rate determined by the Division of Property Taxation to determine income. The income was multiplied by a recommended Hoskold factor to determine the actual value. The Hoskold factor is determined by the life of

the reserves or the lease. Value is based on two variables: life and tonnage. The operator determines these since there is no other means to obtain production data through any state or private agency.

Conclusions

The County has applied the correct formulas and state guidelines to earth and stone production.

Recommendations

VACANT LAND

Subdivision Discounting

Subdivisions were reviewed in 2010 in Conejos County. The review showed that subdivisions were discounted pursuant to the Colorado Revised Statutes in Article 39-1-103 (14) and by applying the recommended methodology in ARL Vol 3, Chap 4. Subdivision Discounting in the intervening year was accomplished by reducing the absorption period by one year.

Conclusions

Conejos County has implemented proper procedures to adequately estimate absorption periods, discount rates, and lot values for qualifying subdivisions.

Recommendations

POSSESSORY INTEREST PROPERTIES

Possessory Interest

Possessory interest property discovery and valuation is described in the Assessor's Reference Library (ARL) Volume 3 section 7 in accordance with the requirements of C.R.S. Chapter 39-1-103 (17)(a)(II)Possessory Interest is defined by the Property Tax Administrator's Publication ARL Volume 3, Chapter 7: A private property interest in government-owned property or the right to the occupancy and use of any benefit in government-owned property that has been under lease, permit, concession, contract, or other agreement.

Conejos County has been reviewed for their procedures and adherence to guidelines when assessing and valuing agricultural and commercial possessory interest properties. The county has also been queried as to their confidence that the possessory interest properties have been discovered and placed on the tax rolls.

Conclusions

Conejos County has implemented a discovery process to place possessory interest properties on the roll. They have also correctly and consistently applied the correct procedures and valuation methods in the valuation of possessory interest properties.

Recommendations

PERSONAL PROPERTY AUDIT

Conejos County was studied for its procedural compliance with the personal property assessment outlined in the Assessor's Reference Library (ARL) Volume 5, and in the State Board of Equalization (SBOE) requirements for the assessment of personal property. The SBOE requires that counties use ARL Volume 5, including current discovery, classification, documentation procedures, current economic lives table, cost factor tables, depreciation table, and level of value adjustment factor table.

The personal property audit standards narrative must be in place and current. A listing of businesses that have been audited by the assessor within the twelve-month period reflected in the plan is given to the auditor. The audited businesses must be in conformity with those described in the plan.

Aggregate ratio will be determined solely from the personal property accounts that have been physically inspected. The minimum assessment sample is one percent or ten schedules, whichever is greater, and the maximum assessment audit sample is 100 schedules.

For the counties having over 100,000 population, WRA selected a sample of all personal property schedules to determine whether the assessor is correctly applying the provisions of law and manuals of the Property Tax Administrator in arriving at the assessment This sample was levels of such property. selected from the personal property schedules audited by the assessor. In no event was the sample selected by the contractor less than 30 schedules. The counties to be included in this study are Adams, Arapahoe, Boulder, Denver, Douglas, El Paso, Jefferson, Larimer, Mesa, Pueblo, and Weld. All other counties received a procedural study.

Conejos County is compliant with the guidelines set forth in ARL Volume 5 regarding discovery procedures, using the following methods to discover personal property accounts in the county:

- Public Record Documents
- Local Telephone Directories, Newspapers or Other Local Publications
- Personal Observation, Physical Canvassing or Word of Mouth

The county uses the Division of Property Taxation (DPT) recommended classification and documentation procedures. The DPT's recommended cost factor tables, depreciation tables and level of value adjustment factor tables are also used.

Conejos County submitted their personal property written audit plan and was current for the 2010 valuation period. The number and listing of businesses audited was also submitted and was in conformance with the written audit plan. The following audit triggers were used by the county to select accounts to be audited:

- New businesses filing for the first time
- Same business type or use
- Non-filing Accounts Best Information Available

Conclusions

Conejos County has employed adequate discovery, classification, documentation, valuation, and auditing procedures for their personal property assessment and is in statistical compliance with SBOE requirements.

APPENDICES

STATISTICAL COMPLIANCE REPORT FOR CONEJOS COUNTY 2010

I. OVERVIEW

Due to data conversion issues, we used the property data files from 2009, which were compiled prior to the conversion. The sale data was taken from post-conversion 2010 data after they were verified by the assessor. Based on the lack of any significant changes between 2009 and 2010 in this county concerning property records, including changes in values assigned by the assessor and sale data between each year, we concluded that this approach represented a valid verification method.

Conejos County is located in south central Colorado. The county has a total of 7,488 real property parcels, according to data submitted by the county assessor's office in 2009. As noted, this represents the near-identical property record dataset for 2010. The following provides a breakdown of property classes for this county:

Real Property Class Distribution

The vacant land class of properties was dominated by residential land. Residential lots (coded 100 and 1112) accounted for 55% of all vacant land parcels, followed by mobile home lots (1135) at 12%.

For residential improved properties, single family properties accounted for 97% of all residential properties.

Commercial and industrial properties represented a much smaller proportion of property classes in comparison. Commercial/industrial sales accounted for 2% of all such properties in this county.

II. DATA FILES

Based on issues with data reliability, we used 2009 property files, including the current value file, the previous value file, the land file and the improvement file; sale data was complied from 2010 files, and were verified for accuracy by the assessor.

III. RESIDENTIAL SALES RESULTS

The following steps were taken to analyze the residential sales:

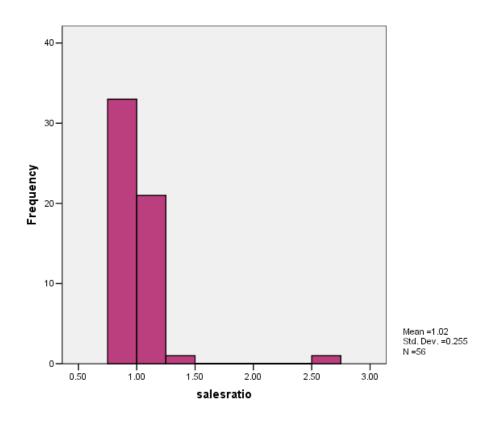

1. Total sales	1,234
2. Qualified sales	69
3. Select residential sales only	59
4. Sales between January 1, 2007 and June 30, 2010	56

The sales ratio analysis results were as follows:

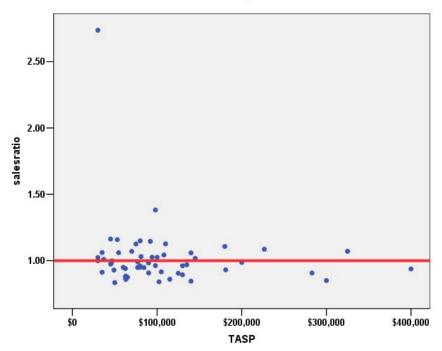

Median	0.979
Price Related Differential	1.028
Coefficient of Dispersion	.111

The above ratio statistics were in compliance with the standards set forth by the Colorado State Board of Equalization (SBOE) for the overall residential sales. The following graphs describe further the sales ratio distribution for these properties:

Residential Sale Price by Sales Ratio

The above graphs indicate that the distribution of the sale ratios was within state mandated limits. No sales were trimmed.

Residential Market Trend Analysis

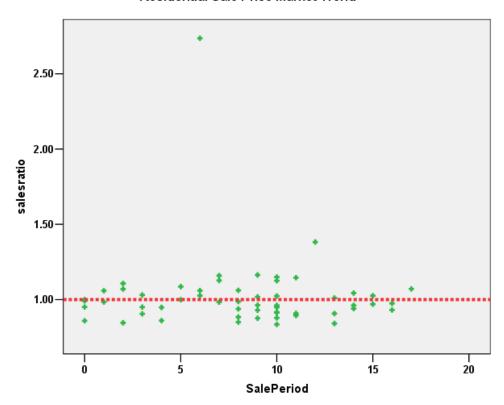

We next analyzed the residential dataset using the 18-month sale period for any residual market trending, with the following results:

Coefficientsa

		Unstandardized Coefficients		Standardized Coefficients		
Model		В	Std. Error	Beta	t	Sig.
1	(Constant)	1.039	.070		14.879	.000
	SalePeriod	002	.008	041	302	.763

a. Dependent Variable: salesratio

Residential Sale Price Market Trend

With no significant statistical trend evident in the sales ratio data, the above analysis indicated that the assessor has adequately addressed market trending in the valuation of residential properties.

Sold/Unsold Analysis

In terms of the valuation consistency between sold and unsold residential properties, we compared the median actual value per square foot for 2010 between each group, as follows:

Group	No.	Median	Mean
Unsold	2,501	\$51	\$62
Sold	56	\$56	\$72

The above results indicate that sold and unsold residential properties were valued in a consistent manner.

IV. COMMERCIAL/INDUSTRIAL SALE RESULTS

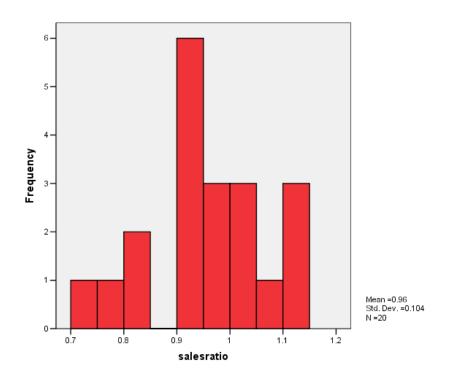

The separate commercial sales file indicated that there were only 13 qualified sales between July 2003 and June 2008. We augmented these sales with 7 supplemental appraisals. Please note that the sales ratio analysis will use all 20 sales and supplemental appraisals, while the market trend analysis and sold/unsold analysis will use just the 13 sales.

The following indicates the results from the ratio analysis of commercial/industrial sales in Conejos County:

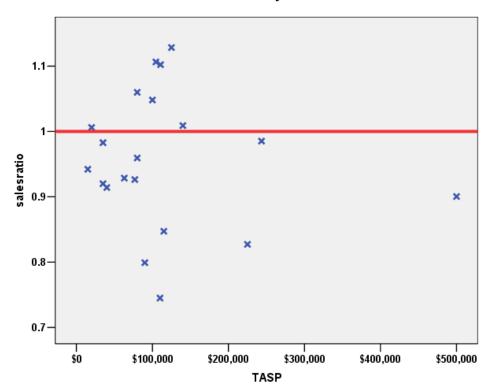

Median	0.951
Price Related Differential	1.013
Coefficient of Dispersion	.086

The above tables indicate that the Baca County commercial/industrial sale ratios were in compliance with the SBOE standards. The following histogram and scatter plot describe the sales ratio distribution further:

Commercial Sale Price by Sales Ratio

Commercial Market Trend Analysis

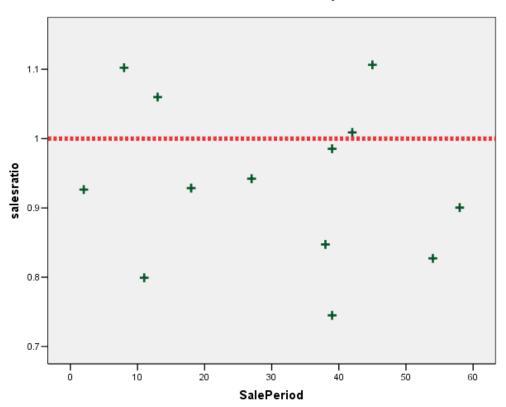

For the market trending and sold/unsold analyses, we used only the 13 qualified sales for Conejos County. The 13 commercial sales were analyzed, examining the sale ratios across the 5 year sale period with the following results:

Coefficientsa

		Unstandardized Coefficients		Standardized Coefficients		
Model		В	Std. Error	Beta	t	Sig.
1	(Constant)	.974	.065		15.106	.000
	SalePeriod	001	.002	199	674	.515

a. Dependent Variable: salesratio

Commercial Market Trend Analysis

The market trend results indicated no significant residual market trend.

Sold/Unsold Analysis

We compared the median actual value per square foot between sold and unsold commercial properties to determine if the assessor was valuing each group consistently, as follows:

Group	N	Median	Mean
Unsold	132	\$16	\$30
Sold	13	\$21	\$26

The above results indicate that sold and unsold commercial properties in Conejos County were valued consistently. Please note that there were too few sales to conclude any statistical inferences from the data.

V. VACANT LAND SALE RESULTS

The following steps were taken to analyze vacant land sales:

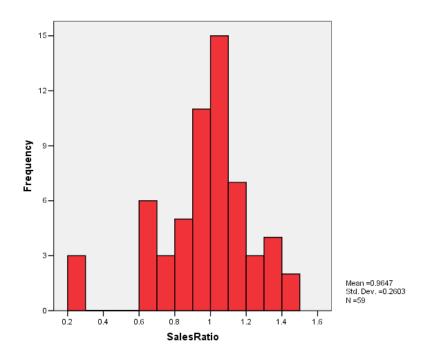

1. Total sales	1,234
2. Qualified sales	69
3. Select non-agricultural sales	59
4. Sales between July 1, 2006 and June 30, 2008	59

The sales ratio analysis results were as follows:

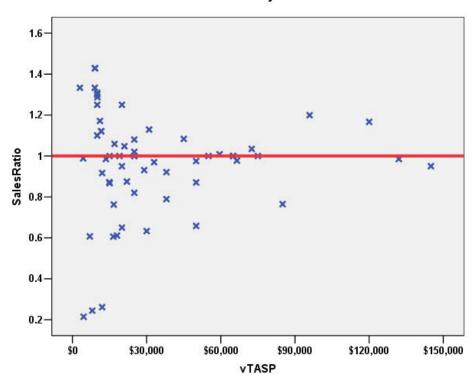

Median	1.000
Price Related Differential	0.990
Coefficient of Dispersion	.180

The above tables indicate that the Conejos County vacant land sale ratios were in compliance with the SBOE standards. The following histogram and scatter plot describe the sales ratio distribution further:

Vacant Land Sale Price by Sales Ratio

Vacant Land Market Trend Analysis

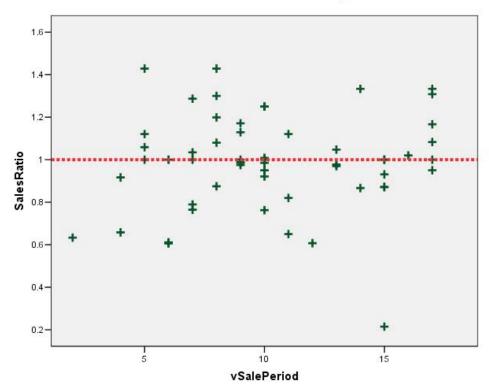

The assessor did not apply any market trend adjustments to the vacant land dataset. The 59 vacant land sales were analyzed, examining the sale ratios across the 18 month sale period with the following results:

Coefficientsa

			lardized cients	Standardized Coefficients		
Model		В	Std. Error	Beta	t	Sig.
1	(Constant)	.940	.085		11.076	.000
	vSalePeriod	.005	.008	.083	.610	.545

a. Dependent Variable: SalesRatio

Vacant Land Sales Market Trend Analysis

The market trend results indicated no statistically significant trend. We concur that no market trend adjustments were warranted for properties in this class for Conejos County.

Sold/Unsold Analysis

We compared the median change in actual value between 2008 and 2010 for vacant land properties to determine if sold and unsold properties were valued consistently (stratified by subdivision), as follows:

SUBDIVNO	Group	N	Median	Mean
4500	Unsold	100	.37	.44
	Sold	3	.37	.40
6667	Unsold	16	1.20	1.20
	Sold	3	1.25	1.23
6789	Unsold	104	1.19	1.14
	Sold	6	1.11	1.00
7777	Unsold	33	1.00	1.06
	Sold	5	1.00	1.08
8181	Unsold	56	1.22	1.26
	Sold	3	1.35	1.37
9876	Unsold	63	1.25	1.20
	Sold	7	1.25	1.17

The above results indicated that sold and unsold vacant land properties were valued consistently overall.

V. AGRICULTURAL IMPROVEMENTS ANALYSIS

The final statistical verification concerned the assigned actual values for agricultural residential improvements. We compared the actual value per square foot rate for this group and compared it to rates assigned to residential single family improvements in Conejos County.

The following indicates that agricultural residential improvements were valued in a manner similar to the single family residential improvements in this county:

Descriptives

	Abstrimp			Statistic	Std. Error
ImpValSF	1212.00	Mean		\$50.15	\$.624
		95% Confidence	Lower Bound	\$48.93	
		Interval for Mean	Upper Bound	\$51.37	
		5% Trimmed Mean		\$46.97	
		Median		\$42.45)
		Variance		968.267	
		Std. Deviation		\$31.117	
		Minimum		\$6	
		Maximum		\$217	
		Range		\$211	
		Interquartile Range		\$35	
		Skewness		1.652	.049
		Kurtosis		3.449	.098
	4277.00	Mean		\$50.75	\$1.006
		95% Confidence	Lower Bound	\$48.77	
		Interval for Mean	Upper Bound	\$52.72	
		5% Trimmed Mean		\$49.22	
		Median		\$45.60)
		Variance		661.256	
		Std. Deviation		\$25.715	
		Minimum		\$6	
		Maximum		\$239	
		Range		\$234	
		Interquartile Range		\$33	
		Skewness		1.368	.096
		Kurtosis		4.648	.191

VI. Conclusions

Based on this statistical analysis, there were no compliance issues concluded for Conejos County as of the date of this report.

STATISTICAL ABSTRACT

Residential

Ratio Statistics for CurrTot / TASP

Mean		1.021
95% Confidence Interval	Lower Bound	.953
for Mean	Upper Bound	1.089
Median		.979
95% Confidence Interval	Lower Bound	.949
for Median	Upper Bound	1.018
	Actual Coverage	95.6%
Weighted Mean		.993
95% Confidence Interval	Lower Bound	.956
for Weighted Mean	Upper Bound	1.029
Price Related Differential		1.028
Coefficient of Dispersion		.111
Coefficient of Variation	Mean Centered	25.0%

The confidence interval for the median is constructed without any distribution assumptions. The actual coverage level may be greater than the specified level. Other confidence intervals are constructed by assuming a Normal distribution for the ratios.

Vacant Land

Ratio Statistics for CurrLnd / vTASP

Mean		.965
95% Confidence Interval	Lower Bound	.897
for Mean	Upper Bound	1.033
Median		1.000
95% Confidence Interval	Lower Bound	.950
for Median	Upper Bound	1.020
	Actual Coverage	96.4%
Weighted Mean		.974
95% Confidence Interval	Lower Bound	.925
for Weighted Mean	Upper Bound	1.023
Price Related Differential		.990
Coefficient of Dispersion		.180
Coefficient of Variation	Mean Centered	27.0%

The confidence interval for the median is constructed without any distribution assumptions. The actual coverage level may be greater than the specified level. Other confidence intervals are constructed by assuming a Normal distribution for the ratios.
