For the U.S. Department of Energy

Rocky Flats Environmental Technology Site

Information Exchange

FIRST QUARTER 2001

Colorado Department of Public Health and Environment

This is a summary of environmental surveillance monitoring performed by the Colorado Department of Public Health and Environment during the past calendar quarter. Data for earlier periods that have not already been reported may also be included.

Revised 6/11/01

If you have questions or comments about this report, or if you would like to be placed on the mailing list to receive copies of this report in the future, please write to:

Introduction

The purpose of this Environmental Surveillance Report (ESR) is to provide a quarterly update on Colorado Department of Public Health and Environment (CDPHE) air and surface water monitoring data at the Rocky Flats Environmental Technology Site (RFETS).

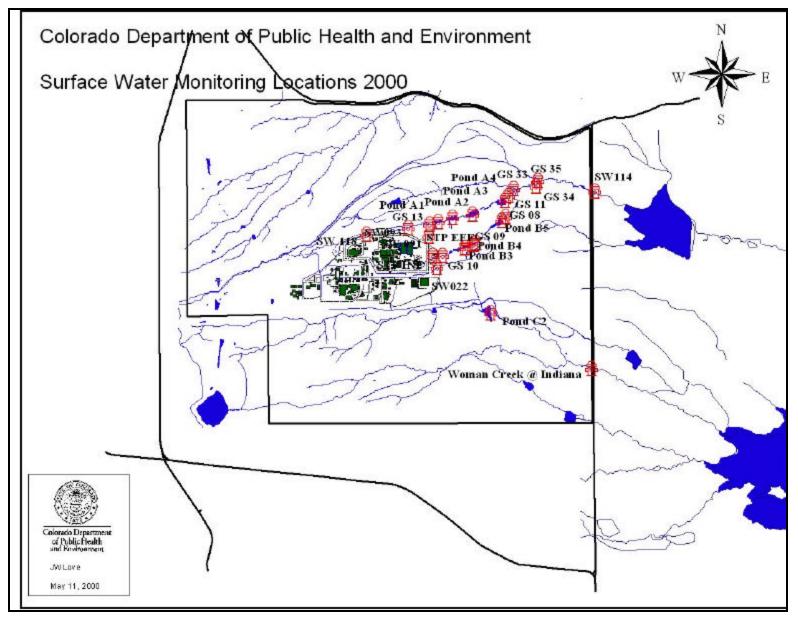

CDPHE currently has three Divisions that conduct monitoring at RFETS including the Air Pollution Control Division (APCD), the Hazardous Materials Waste Management Division, and the Laboratory and Radiation Services Division (LARS). APCD monitors air for contaminants such as particulates, oxides of nitrogen, ozone, volatile organic compounds (VOCs), radionuclides and beryllium. The Hazardous Materials Waste Management Division conducts surface water monitoring for many parameters, including metals, inorganics and radionuclides. The Radiation Control Division performs radiological monitoring in air and precipitation.

Under normal conditions, groundwater and soils are not monitored by Colorado Department of Public Health and Environment (CDPHE), but are monitored by DOE.

Sampling and data analysis is performed by CDPHE according to the Rocky Flats Integrated Monitoring Plan (IMP), which describes not only the monitoring done by CDPHE, but also that done by the Site and surrounding communities. It is possible that CDPHE may do some additional sampling as part of a special study or for some unusual circumstances. This report describes the results of both types of CDPHE monitoring.

2000 Air Monitoring Stations

2000 Water Monitoring Stations

Decision Rules

The data acquired for each quarter is examined using standard methods of evaluation that are described in the Integrated Monitoring Plan (IMP). The methods use a series of decision rules to effectively analyze the data that has been collected, and make determinations about what actions need to be taken. Decision rules are if-then statements pertaining to data quality objectives. The decision rules define, quantitatively and qualitatively, the point at which a decision should be made or action should be taken.

The decisions could involve many different actions including, but not limited to, further analysis of data, implementation of new monitoring stations for source detection, management decisions, or evaluation of remediation alternatives. Any exceedence of an action level for a surface water or air contaminant during the quarter are summarized in this report, along with any actions taken or follow up investigations that are required.

The primary decision rules that pertain to each media are outlined below:

A. Air Monitoring

1. <u>Ambient Air Quality Monitoring</u>: Nitrogen Dioxide (NO₂), Ozone (O₃) and particulate monitoring is performed by APCD. Particulate monitoring includes monitoring of both fine particulates (PM₁₀) and total suspended solids (TSP).

| IF: | A perimeter monitor detects an NO ₂ (annual arithmetic mean) concentration of 0.053 parts per million (ppm), an O ₃ (1 hr av. time) concentration of 0.12 ppm, a TSP measurement of 75 μ g/m ³ averaged over a 1 year time period or 150 μ g/m ³ over a 24-hour time period, or a PM ₁₀ concentration of 50 μ g/m ³ annually or 150 μ g/m ³ in a 24-hour period (Include these values in a table in the report, too confusing this way) |
|-------|--|
| THEN: | The Site's operating permit may potentially be revised to mitigate the exceedence. |

2. <u>Beryllium (Be) Monitoring</u>: Emission points (stacks) are monitored for Be.

IF: Be emissions from a source exceed 10 g in a 24-hour period

THEN: CDPHE may take enforcement action.

IF: Ambient Be concentrations at monitoring sites exceed 0.01 μ g/m³ over a 30-day Period

THEN: CDPHE may take action to identify the source.

- 3. <u>Volatile Organic Compound (VOCs) Monitoring</u>: Various VOC monitoring stations exist around the perimeter of the site and are maintained by APCD. It is possible that remediation processes could release significant levels of VOCs. VOC data does not tend to vary and the measured concentrations are generally very low. A significant increase from normal levels of any VOC at any monitoring site could indicate a potential problem.
 - IF: A measured value of any VOC exceeds trends in historical data
 - THEN: An investigation will be enacted to determine the source of the elevated VOC concentration.
- 4. <u>Radiological Ambient Air Quality Monitoring</u>: Laboratory and Radiation Services Division (LARS)and Air Pollution Control Division (APCD) air sampling locations are monitored for radiological contaminants, PM₁₀ and total suspended particulates (TSP).
 - IF: Measured values of radionuclides exceed typical trends existing in historical data
 - THEN: Any number of actions may be taken including, but not limited to, analysis of samples for verification, comparison of samples from nearest DOE monitoring sites, ComRad Program samplers, and/or APCD monitoring sites, request for investigation or explanation of elevated results from DOE, calculation of public dose/risk and/or a presentation to CDPHE management.

B. Surface Water Monitoring

- 1. <u>Source Location</u>: Current surface water monitoring sites monitor for Analytes of Interest (AoIs) and indicator parameters for AoIs. Contaminant levels that exceed historical trends at a certain site could indicate the presence of a new contaminant source. When a new contaminant source is identified by a current monitoring location, it may be necessary to implement additional monitoring sites to identify the exact location of the new source.
 - IF: A new contaminant source is identified by any monitoring station
 - THEN: Action should be taken to locate and quantify the source. Mitigation action will be taken pursuant to the Rocky Flats Cleanup Agreement (RFCA) Action Level Framework (ALF).
- 2. Wastewater Treatment Plant (WWTP) Influent Radiological Monitoring: The Site has made an effort to eliminate any possible connections between waste streams containing radionuclides and WWTP influent. Therefore, it is assumed that radiologic loads will not significantly increase from baseline values. Radiologic parameters include total plutonium, total americium, total uranium, tritium, as well as alpha and beta activity. Decontamination and decommissioning (D&D) activities could potentially introduce radiologic loads to WWTP influent. The influent is monitored to track sources of contaminants that may be introduced during the cleanup process.
 - IF: Influent loading for any of the radiologic parameters exceeds baselinevalues determined from historical data
 - THEN: Evaluation will be performed to determine the source of contamination.

- 3. <u>Pond Predischarge Monitoring</u>: AoIs and some volatile organic compounds (VOCs) are monitored in the ponds previous to pond discharge so that discharge will not result in exceedence of stream standards.
 - IF: Predischarge monitoring shows exceedence of stream standards
 - THEN: CDPHE will notify the Site. At this point the Site may evaluate alternative options which avoid immediate discharge including, but not limited to, treatment, storage or disposal.
- 4. <u>Precipitation Sampling</u>: LARS is involved with sampling precipitation for gross alpha/beta, Pu-239/240, Am-241 and Tritium.
 - IF: Any measurement of radionuclides in precipitation exceeds the normal variation occurring in historical and baseline measurements
 - THEN: A series of actions may be taken including, but not limited to, reanalysis of the samples, analysis of individual ambient air filters from the same quarter, request for analysis of nearby filters from DOE, ComRad, or APCD sample sites, request for investigation, request for CDPHE and DOE modeling to determine environmental effects.

Analytes of Interest

| Analytes | | Air | Water | Purpose of Monitoring |
|---------------|------------------------------------|-----|-------|--|
| Radionuclide: | Pu | X | X | High level of public concern. Known carcinogen. Known past releases (within the past 8 years) have exceeded RFCA stream standards and action levels. This provides reasonable cause to expect future releases in excess of RFCA Action Levels. |
| | U | X | X | Known renal toxicity. Past exceedances provide reasonable cause to expect future releases in excess of RFCA stream standards and action levels. |
| | Am | X | Х | Known carcinogen. Known past exceedances provide reasonable cause to expect future releases in excess of RFCA stream standards and action levels. |
| | Tritium | | X | Is an AOI due to past releases to drinking water supplies |
| Metals: | Be | X | Х | Known to cause berylliosis in susceptible individuals when exposed in inhalation. May also cause contact dermatitis. Will be monitored as an indicator of releases from process and waste storage areas. |
| | Cr | | X | Physiological and dermal toxicity. High level of regulatory concern due, in part to the chromic acid of incident of 1989. Low levels can cause significant ecological damage. |
| | Ag | | X | Highly toxic to fish at low levels, if chronic. State of Colorado has temporarily removed its stream standard for silver, while under study. The study has been completed, and the standard will be reinstated at the next triennial review of South Platte stream standards, if not before. Used at RFETS only for photographic development. Routinely accepted by POTWs as municipal waste, but discharge is regulated. May be removed from this list later if data do not support concern. |
| | Cd | | X | Highly toxic to fish at low levels, if chronic. Known human carcinogen (prostate cancer) and depletes physiologic calcium. Used at RFETS in plating processes. Monitoring data for the Interceptor Trench System (ITS) and the proposed discharge of untreated ITS waters into Walnut Creek provide reasonable cause to expect future releases in excess of RFCA Action Levels |
| | Hardness | | Х | Required to evaluate metals analyses, due to its effect on solubility to these metals. |
| Particulates: | Total suspended particulates | X | | Monitored to provide information on total airborne particulate levels. Filters also used for metals and radionuclides analyses. |

| | PM ₁₀ particulates | X | | Monitored to provide information on fine airborne particulate levels. Filters also used for metals and radionuclides analyses. |
|---|----------------------------------|---|---|--|
| Volatile Organic Compounds: | VOCs | Х | Х | A variety of volatile organic compounds, some of which are toxic to humans and ecology. Known discharges to air and water as well as groundwater infiltration. |
| Real Time Monitoring of Physical and Indicator Parameters: (These parameters provide real-time indication for a | рН | | Х | Toxicity to humans and ecology. Regulatory concem due to chromic acid incident. Real-time monitoring is an inexpensive and effective method of detecting acid spills such as (chromic acid or plutonium nitrate) or failure of treatment systems. |
| wide variety of regulated contaminants, and are also required component for monitoring for AoIs. They | Conductivity | | Х | Conductivity is an indicator of total d issolved solids, metals, anions, and pH. Real-time monitoring of conductivity is an inexpensive indicator of overall water quality. |
| require no laboratory analysis and are the RFETS | Turbidity | | Х | Turbidity is a general indicator of elevated contaminant levels, and may be correlated with Pu. |
| most cost effective defensive monitoring.) | NO ₃ | | Х | Past releases near RFCA stream standards and action levels upstream of ponds provide reasonable cause to expect future releases in excess of RFCA stream standards and action levels. ITS discharges are often high in nitrate, and may challenge RFCA action levels. |
| | Flow | | Х | Required to detect flow events, evaluate contaminant loads and plan pond operations and discharges. Affects nearly every decision rule, and is the most commonly discussed attribute of RFETS surface waters. |
| | Oxides of Nitrogen | Х | | Monitored due to RFETS historical use of nitric acid. |
| | Ozone | Х | | Monitored as part of the CDPHE network. Not required or part of monitoring for RFETS. |
| | Wind speed | Х | | Monitored to provide emergency response modeling information. |
| | Wind direction | Х | | Monitored to provide emergency response modeling information. |
| | Temperature | Х | | Monitored to provide emergency response modeling information. |

NATIONAL AMBIENT AIR QUALITY STANDARDS

| POLLUTANT | AVERAGING TIME | STANDARD |
|--|---|-------------------------|
| Carbon Monoxide (CO) | | |
| Primary Standard | 1 Hour ^(a) | 35 ppm |
| Primary Standard | 8 Hour ^(a) | 9 ppm |

| Primary Standard | Annual Geometric Mean ^(g) | 75 ì g/m ³ |
| Primary Standard | 24 Hour ^(g) | 260 ì g/m ³ |
| Secondary Standard | Annual Geometric Mean ^(g) | 60 ì g/m ³ |
| Secondary Standard | 24 Hour ^(g) | 150 ì g/m ³ |

(a) Not to be exceeded more than once per year.

⁽b) Statistically estimated number of days with concentrations above this level averaged over a three year period, is not to be more than 1 per year.

⁽c) The three year average of the fourth maximum value for each year is not to exceed this level.

⁽d) The average of three years of annual averages (bas ed on quarterly averages) is not to exceed this level. The three year average of the 99th percentile for each year is not to exceed this level. The three year average of the 98th percentile for each year is not to exceed this level.

⁽e)

⁽f)

⁽g) The TSP standard was replaced by the PM₁₀ standard on July 1, 1987. TSP is now a State standard only and was temporarily suspended from 30 August 1993 to 30 October 1995 by the AQCC.

Standards for Inorganics and Metals

*There is no unionized ammonia standard for Segment 5 or Segment 4b. A standard of 0.1 mg/L applies to Segment 4a.

**The standards for these metals were calculated using a formula based on hardness. A hardness value of 143 mg/L was used because this is the average hardness found in these waters.

Description of Air Sampling this Quarter

Table A contains the complete gross alpha /gross beta results for the first quarter of 2001. Table B contains complete plutonium and americium results for the fourth quarter 1999 and for the first through third quarters of 2000. All of these data show no obvious anomalies compared to historical data.

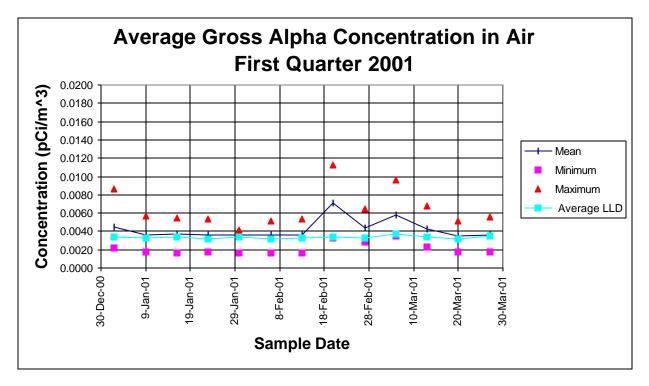

Oxides of nitrogen and ozone data for the first quarter of 2001 are presented in Table D. Average oxides of nitrogen levels were typical to slightly higher than historical values for the period, though still very low. Maximum hourly nitric oxide levels were higher than typical for the period while nitrogen dioxide levels were more typical. Ozone concentrations for the quarter were at typically low wintertime levels. Particulate concentrations for the first quarter of 2001 are presented in Table E. Average PM_{10} levels for the period were slightly higher than typical historical levels, but still well below the Federal standards. The 24-hour maximum PM_{10} levels were typical. Average and maximum TSP levels were typical for the period.

No new beryllium and uranium data (Table F) are available at this time. Volatile organic compound analyses for all four quarters of 2000 are presented in Table G. These data show that, as in the past, BTEX and Freon compounds are generally detected in the highest amounts, but still at very low levels compared to workplace Threshold Limit Values. For 2000, the highest 24-hour concentrations recorded were 2.39 ppb for chloromethane at X-1, 2.37 ppb for Freon 134a at X-5, 1.42 ppb for toluene at X-3, 1.01 ppb for Freon 12 at X-4 and 0.86 ppb for benzene at X-3.

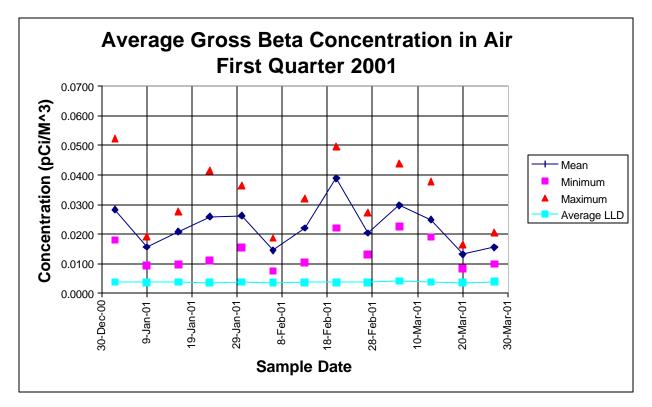

Currently, significant cuts in the CDPHE air monitoring network have been proposed. These proposed cuts are in response to the changing mission of the Rocky Flats Plant, the very low levels being monitored, and the current status of the demolition and decontamination activities. Additionally, some of the proposed cuts are to eliminate some of the redundancy between the monitoring networks. A presentation on the proposals will be formally made at an upcoming Integrated Monitoring Plan (IMP) meeting and will include:

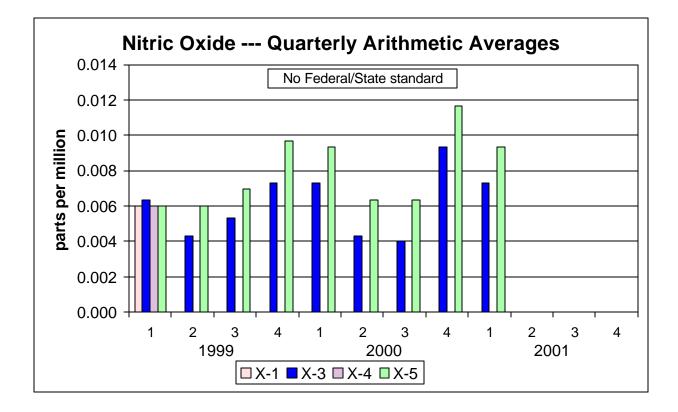

- 1. Discontinuing every sixth day PM₁₀ and TSP sampling at X-1, X-2, X-3, X-4 and X-5 sites.
- 2. Moving some of the "D" (ground level) continuous TSP sites and analyses to some of the "X" sites.
- 3. Discontinuing some analyses at the E-1 elevated site.
- 4. Discontinuing the E-3 elevated site.
- 5. Discontinuing beryllium and isotopic uranium analyses from every sixth day PM₁₀ and TSP sampling at X-1, X-2, X-3, X-4 and X-5 sites.
- 6. Discontinuing americium and plutonium analyses from every sixth day PM₁₀ and TSP sampling at the X-5 site.
- 7. Discontinuing every sixth day volatile organic compound sampling at X-1, X-2, X-3, X-4 and X-5 sites.
- 8. Discontinuing oxides of nitrogen sampling at X-3 and X-5 sites.

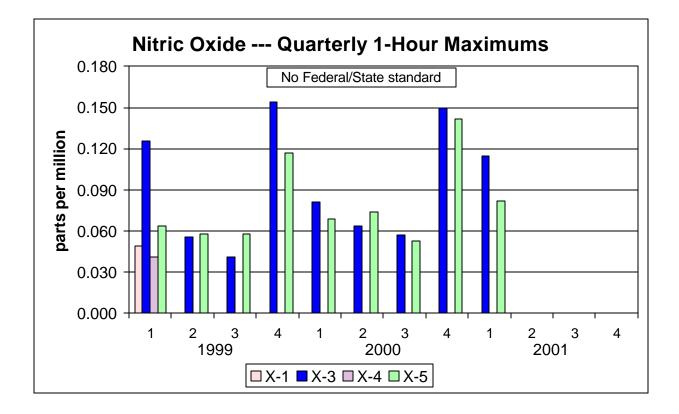

Graphical Presentation

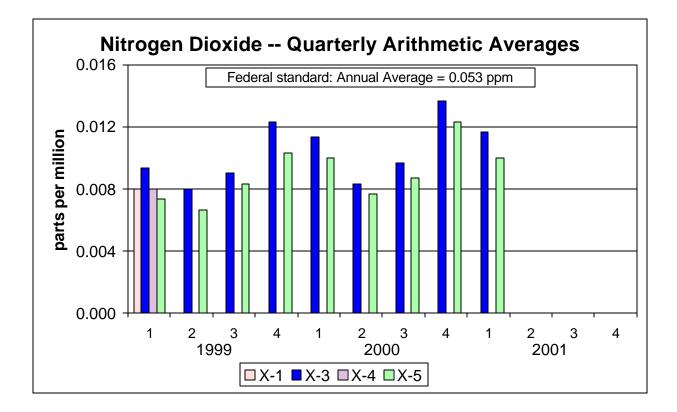

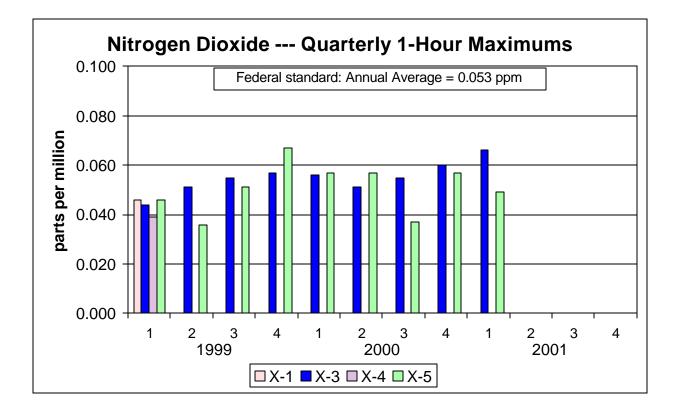

Graphs of pertinent and abnormal data from air monitoring are presented in this section.

Description of Precipitation and Surface Water Sampling Done This Quarter

Precipitation

Precipitation sampling was halted in March, 2001. No additional samples will be collected. This and other changes to the State's monitoring program will be presented at an upcoming Integrated Monitoring Plan (IMP) meeting

Surface Water

For surface water, sampling for the 1st quarter of 2001 was done as follows:

3 samples of the Sewage Treatment Plant Influent were collected, on 1/19/2001, 2/28/2001, and 3/21/2001

1 Sewage Treatment Plant Effluent sample was collected, on 2/28/2001;

1 pre-discharge sample was collected from Pond B-5 - on 2/21/2001;

1 sample was collected from Walnut Creek at Indiana Street, on 3/12/2001;

1 split sample from the RFET's sampler at GS03 was picked up on 1/31/2001;

1 round of nitrate sampling was done on 2/12/2001, at SW093, GS13, GS10, STP-Outfall, Pond A4, and Pond A5.

1 grab sample was collected from GS10 and analyzed only for radionuclides.

The results of these sampling events are shown in Table H (all but organic results) and Table I (organic results).

Notable Surface Water Results

During this quarter, there was only one analytical result that exceeded action levels or water quality stream standards. This was the silver result for the sampling done at Walnut Creek at Indiana Street station on March 12, 2001. The silver result for that sample was 1.3 ug/l, while the stream standard is 0.6 ug/l (as calculated for the existing Action Level Framework).

The laboratory was contacted, and quality assurance information indicates that the result is accurate. Since this was a grab sample, and the standard of 0.6 ug/l is a chronic standard, this result was not considered to be of immediate concern. Silver has not been routinely detected at a levels approaching or above the stream standard at this location. Still, this result does indicate that monitoring for silver at this location should be continued.

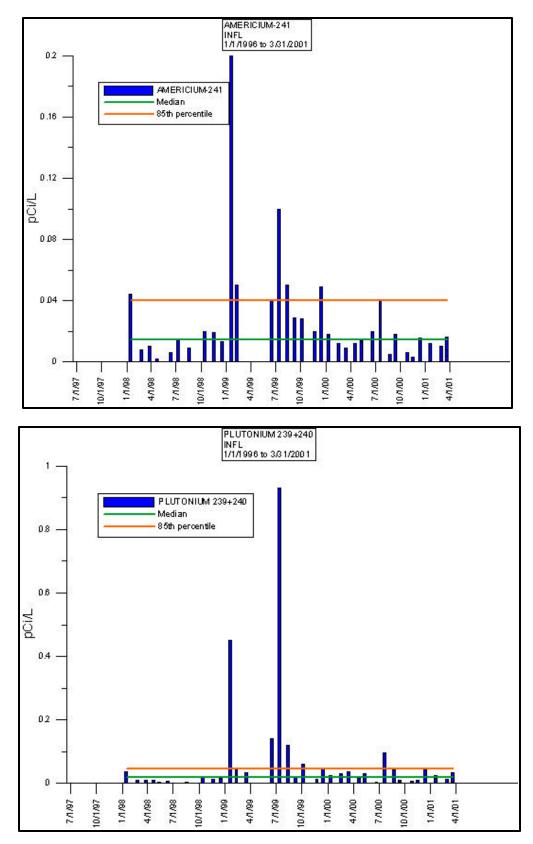

None of the other results for this quarter exceed water quality standards or are of immediate concern. Results for the most

critical parameters - americium and plutonium, are presented along with historical values in the following graphs for selected

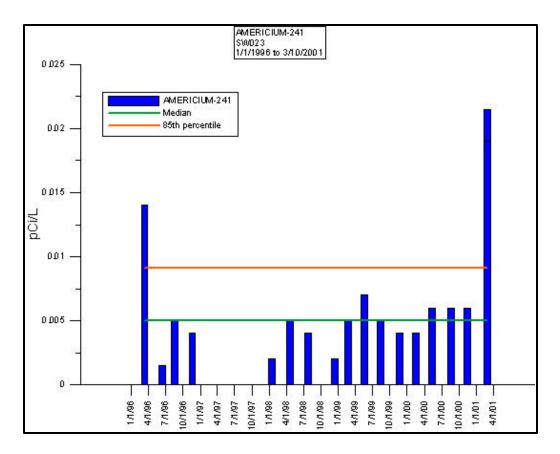

stations monitored this quarter. Note that no Am or Pu analyses are performed by CDPHE for Indiana Street stations.

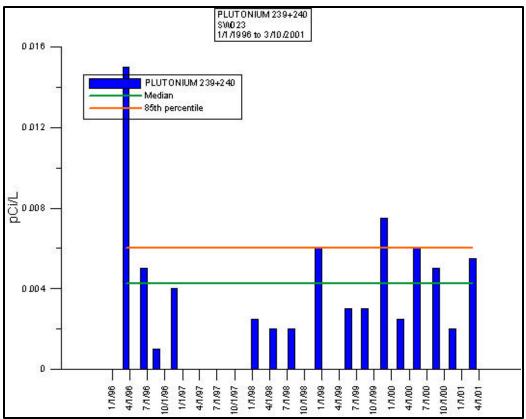

Nitrate results for stations SW093, GS13, and GS10, which are the most important to track, are also graphed. With respect to organic chemicals, Table I shows that one organic chemical was detected, but only at very low levels.

Graphs of Selected Surface Water Results
