# **Executive summary**

The Colorado 2022 Integrated Water Quality Monitoring and Assessment Report summarizes water quality conditions in the State of Colorado. This Integrated Report (IR) satisfies the reporting requirements of the Clean Water Act Sections 303(d), 305(b), and 314, which requires all states to assess and report on the quality of all waters within their state every two years. This report summarizes the quality of Colorado's waters from July 1, 2019, through June 30, 2021 (State Fiscal Year 2020-2021). This report covers the Environmental Protection Agency's (EPA) 2022 reporting cycle. The last full comprehensive report for Colorado was completed in 2020.

This Integrated Report includes a summary of water quality assessment efforts, including the attainment status of all surface waters in Colorado according to the five reporting categories. It also provides information about the Colorado Water Quality Control Division (division) water pollution control program, the groundwater program, and the Safe Drinking Water Program. A section discussing special state concerns is also presented in this report.

The following highlights are discussed in more detail:

- The division's response to COVID-19
- Colorado's efforts to address PFAS contamination
- Direct potable reuse (DPR)
- The division's response to wildfires
- A description of Colorado's new reporting subcategories 1a and 1b

# Assessment efforts during 2020 and 2021

The division assesses water quality across the state in five-year cycles, focusing on a quadrant of the state each year. Surface water quality assessments over the past two years focused on the San Juan and Dolores River Basins (Regulation 34), the Gunnison and Lower Dolores River Basins (Regulation 35), and where outstanding issues were identified statewide.

A vastly improved geodatabase based on the National Hydrography Dataset provided the division with greater accuracy in waterbody sizes for Colorado, resulting in greater levels of confidence for estimates of the percent of attaining/non-attaining waterbodies. All of the summary calculations done in this report are based on Colorado's version of the National Hydrography Dataset at 1:100,000 resolution.

Summary tables in this report and its appendices use Assessment Units Identifications (AUIDs) with segment or portion descriptions retrieved from the Colorado Integrated Report database (ATTAINS). An assessment unit consists of the waterbody identification with an underscore and a letter (\_A,\_B, etc.). These assessment units represent the portions of waterbodies that have been listed and tracked through the assessment database. Each assessment unit is unique, with no spatial overlap.

# Surface water quality and use support

Surface water quality standards have been established to be protective of all applicable uses. Waterbodies in Colorado may be assigned any of the five following categories of use classifications: aquatic life, recreation, water supply, wetlands, or agriculture. One goal of the Clean Water Act is that all classified waters of the state fully support "fishable" and "swimmable" use classifications.

Each assigned classified use fits into one of the five reporting categories:

# Category 1

- Attaining water quality standards for all classified uses.
  - 1a Attaining water quality standards
  - 1b Attaining water quality standards (with an approved TMDL)

## Category 2

 Attaining water quality standards for those classified uses that have been assessed. Not all classified uses have been assessed.

# Category 3

- Insufficient data to determine whether or not the classified uses are being attained.
  - 3a No water quality data has been collected
  - 3b Segment placed on the Monitoring and Evaluation List (M&E List)

# Category 4

- Not supporting a standard for one or more classified uses, but a TMDL is not needed.
  - 4a TMDL has been completed
  - 4b Plan for attainment of water quality standards
  - 4c Impairment due to pollution

# Category 5

- Not meeting applicable water quality standards for one or more classified uses by one or more pollutants (303(d) List), and a TMDL is needed.
  - 5-alt Alternative restoration approaches

# Assessment results summary

For the 2022 Integrated Report, a total of 85,356 river miles and 186,734 lake acres were assessed. The total river miles and lake acres may change from cycle to cycle due to a number of factors, including the discovery of previously unmapped waterbodies or corrections to the existing hydrography to account for undesignated waters, such as irrigation canals. For Colorado streams and rivers, 46,473 miles supported all classified uses (Category 1a), which is about 51% of the total miles. An additional 1,526 miles (2%) supported at least one classified use (Category 2), and a total of 27,451 miles (30%) were found to be impaired, requiring the development of a TMDL (Category 5). The remaining river miles and percentages fall into categories 3 and 4. All reporting categories for rivers and streams are summarized in Table 1 and Figure 1.

Table 1. Category summary for Colorado's rivers and streams

Category	Category Definitions	Size (Miles)	Number of Assessment Units
Category 1a	Attaining	46,473	349
Category 1b	Attaining (with approved TMDL)	34	5
Category 2	Supports some designated uses	1,526	20
Category 3a	No water quality data	6,055	101
Category 3b	Monitoring and Evaluation List	8,710	148
Category 4a	Impaired with approved TMDL	1,162	53
Category 4b	Impaired with 4b plan	0	0
Category 4c	Impaired due to pollution	0	0
Category 5	Impaired without completed TMDL	27,451	540

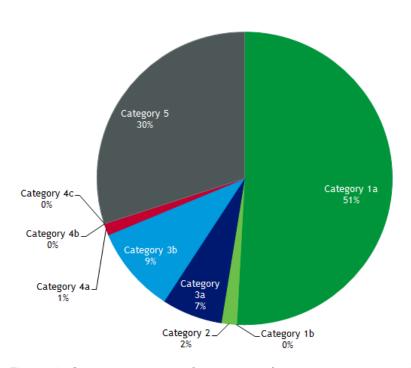

Figure 1. Category summary for rivers and streams as percent of total river/stream miles.

For Colorado lakes, 84,265 acres fully supported all classified uses (Category 1a), which is about 31% of the total acres. An additional 2,515 acres (1%) supported at least one classified use (Category 2), and a total of 84,515 acres (31%) were found to be impaired, requiring the development of a TMDL (Category 5). The remaining lake acres and percentages fall into categories 3 and 4. All reporting categories for lakes and reservoirs are summarized in Table 2 and Figure 2.

Table 2. Category summary for Colorado's lakes and reservoirs

Category	Category Definitions	Size (Acres)	Number of Assessment Units
Category 1a	Attaining	84,265	57
Category 1b	Attaining (with approved TMDL)	0	0
Category 2	Supports some designated uses	2,515	6
Category 3a	No water quality data	84,712	170
Category 3b	Monitoring and Evaluation List	13,877	17
Category 4a	Impaired with approved TMDL	1,562	4
Category 4b	Impaired with 4b plan	0	0
Category 4c	Impaired due to pollution	0	0
Category 5	Impaired without completed TMDL	84,515	83

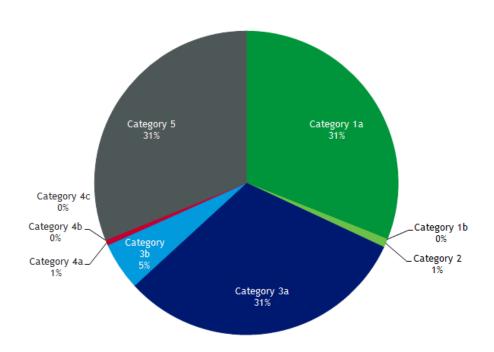

Figure 2. Category summary for lakes and reservoirs as percent of total lakes/reservoirs acres.

## Assessment units impaired — 303(d) List

Stream and lake segments that do not fully support classified uses are defined as impaired and placed on the Colorado Section 303(d) List of Impaired Waters. The 2022 Section 303(d) List identified 540 impaired (category 5) assessment units for streams, with 32 individual pollutants on those segments requiring the development of TMDLs (category 5). For lakes, 83 assessment units were identified as impaired (category 5), with 32 individual pollutants. For both streams and lakes, the total number of impairments on the 303(d) List increased relative to the 2020 listing cycle. For streams, the total number of impairments increased by 17 assessment units; and for lakes, the number of impairments increased by 6 assessment units. This increase is mainly due to changes in the 303(d) Listing Methodology, table value standards, and increased monitoring. The 2022 Monitoring and Evaluation List (category 3b) includes 392 assessment units (both lakes and streams) with 30 individual pollutants. This is an increase of 29 assessment units compared to the 2020 listing cycle.

## Use support summaries

### Rivers and streams

Table 3. Use support summary for Colorado's rivers and streams

Use	Fully Supporting	Not supporting	Insufficient Data	Not Assessed
Aquatic life	75%	11%	7%	7%
Domestic water supply	51%	30%	10%	9%
Recreation	86%	3%	3%	8%
Agriculture	92%	1%	0%	7%
All uses	78%	10%	5%	7%

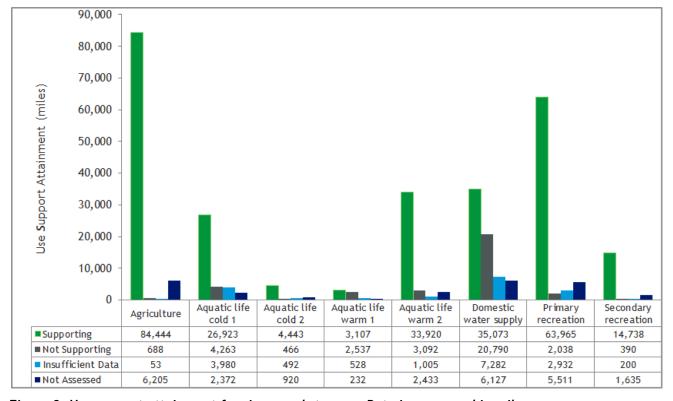

Figure 3. Use support attainment for rivers and streams. Data is expressed in miles.

## Lakes and reservoirs

Table 4. Use support summary for Colorado's lakes and reservoirs

Use	Fully Supporting	Not supporting	Insufficient Data	Not Assessed
Aquatic life	40%	28%	2%	30%
Domestic water supply	46%	18%	6%	30%
Recreation	65%	0%	0%	35%
Agriculture	66%	0%	0%	34%
All uses	54%	12%	2%	32%

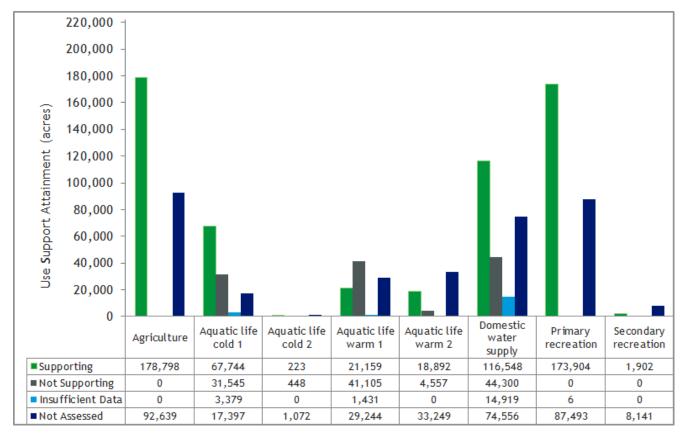

Figure 4. Use support attainment for lakes and reservoirs. Data is expressed in acres.

# Special state concerns

This section discusses special concerns that are significant issues within Colorado that affect the division programs.

# The division's response to COVID-19

Throughout the COVID-19 pandemic, the division adapted and remained resilient - maintaining its core duties and exploring approaches to fight the virus. Key accomplishments include:

- Providing assistance and guidance to water and wastewater utilities so they could continue their essential critical functions protecting public and environmental health no one reported any system failures in the 2020 pandemic year.
- Developing standard operating procedures that kept staff safe but allowed field inspections to continue.
   While COVID-19 led to an overall decrease in inspections, these procedures allowed the division to complete 141 in-field drinking water inspections and 458 clean water inspections during the pandemic. Of the clean water inspections, 380 were reconnaissance inspections, which allowed the division to maintain oversight while social distancing.
- Launching a pilot program to track the COVID-19 virus in wastewater which can give health professionals an idea of how prevalent the virus is in their community, sometimes days in advance of an outbreak and even if people are asymptomatic. The pilot was successful and the department is planning to continue to fund this effort and use the information for ongoing pandemic response.
- Partnering with associations and networks to share resources such as operator personnel, masks, and COVID-19 updates and information.
- Adapting operations to better accommodate an online-only work world, including allowing electronic signatures and shifting to virtual meetings and training. Since the shift, we have had historic levels of stakeholder engagement in division and Water Quality Control Commission (commission) meetings.

# Colorado's efforts to address PFAS contamination

Colorado faces an emerging health challenge from per- and polyfluoroalkyl substances, or PFAS, which are man-made chemicals that have properties that make them useful for consumer and industrial use, but also make them persistent in the environment. PFAS chemicals from firefighting foam, personal products, and other substances are toxic and can get into our groundwater and surface water, contaminating drinking water supplies. We are still learning about health effects from exposure to these chemicals, but studies have found serious potential impacts including pregnancy complications, developmental delays in children, and increased cholesterol. In May 2016, to safeguard people, including the most sensitive populations, with a margin of protection from these chemicals in drinking water, the EPA released a health advisory of 70 parts per trillion (ppt) for PFOA and PFOS. Health advisories are not enforceable regulatory standards, and there is currently no national PFAS regulatory standard.

These chemicals have created an emerging, urgent public health challenge requiring enhanced action to avoid future contamination and ensure safe drinking water. Monitoring data from a 2020 statewide PFAS sampling effort found 34% of the participating drinking water systems had some level of PFAS chemicals in their drinking water and all of the samples taken from lakes and rivers had some detectable level of the chemicals. None of the treated drinking water being served to customers is currently exceeding the EPA health advisory. The Colorado

Department of Public Health and Environment (department) has taken action and worked with public water systems, EPA, local health departments, universities and industry to address the situation. In the summer of 2019, The department developed an action plan for addressing PFAS contamination in Colorado, which includes steps to minimize the risk of additional contamination and respond to communities where PFAS chemicals are found at levels that could affect health.

When PFAS are released into the environment, they can enter rivers and underground aquifers that may be used as drinking water sources. Once a water source has been contaminated, human exposure to PFAS can occur through direct ingestion, by consuming organisms from contaminated waterbodies, or through indirect ingestion of crops irrigated with contaminated groundwater. To obtain a better and more complete understanding of drinking water supplies at risk in the state, the department has prioritized testing at public drinking water systems, private potable wells potentially impacted by PFAS, and/or sites with known use of PFAS-containing material.

### Statewide efforts

The department developed an action plan for addressing PFAS contamination in Colorado to reduce further environmental contamination, assess existing contamination and support impacted communities.

## Department efforts to address PFAS:

#### Reduce further environmental contamination

- The department pursued a statewide policy for water quality permits implementation to address potential PFAS in wastewater discharges. Through an extensive stakeholder effort, the department drafted and proposed the PFAS Narrative Policy. The commission adopted the policy in the summer of 2020. The policy outlines the requirements for facilities permitted to discharge wastewater to state waters regarding detection limits for PFAS and provides the department with guidance for setting PFAS limits on wastewater discharges.
- The Solid and Hazardous Waste Commission adopted the department's proposed rules, as part of House Bill 20-1119, requiring entities to register by June 1, 2021 that have or use firefighting foam containing PFAS. The rules include capture and disposal standards for entities that test with firefighting foam containing PFAS. The department worked closely with stakeholders in drafting the rules.
- The department created a toolbox to assist drinking water providers with assessing, preventing and responding to PFAS contamination and integrated PFAS into source water protection planning in collaboration with Colorado Rural Water Association.
- The department is in the process of developing and administering a PFAS takeback program for the purchase and storage of firefighting foam containing these chemicals until we can safely dispose of it.

### Assess existing contamination

- With \$500,000 awarded from the state legislature, the department facilitated the sampling of 400 water systems and 15 firefighting districts, as well as 152 groundwater sources and 71 surface water sources like rivers and streams in the spring of 2020. The department found that none of the treated drinking water tested was above EPA's health advisory level, but did find higher levels of PFAS in some groundwater sources and surface water. See the <a href="PFAS projects website">PFAS projects website</a> for more information.
- In 2020, the department required facilities that discharge treated wastewater, water used for manufacturing, and other similar activities to state water bodies to respond to a survey and indicate their use and storage of certain products containing PFAS. One hundred and ninety three (193) facilities self-reported a known or suspected presence of these chemicals. The results provided a better

- understanding of the use of these chemicals and risks to state waters. These results also helped determine if specific permits may need PFAS monitoring. The department posted a map of facilities that discharge to state waters and reported a known presence of PFAS.
- The department approved a plan to be able to use EPA Region 8's lab for PFAS analysis for investigating impacts to private wells and surface waters. In the summer of 2021, the department partnered with Tri County Health Department, Boulder County Public Health and Summit County Environmental Health Department to start sampling projects to test these chemicals in potentially at risk private wells.
- The department completed a pilot project for sampling fish tissue for PFAS. This is a collaborative project with Colorado Parks and Wildlife and Colorado School of Mines. All fish and water samples are at the School of Mines lab for analysis. The department anticipates receiving and sharing the results when they become available.
- In the summer of 2021, the department started a project to develop a vulnerability map to help determine where we should prioritize PFAS sampling. This map will use many sources of data to determine possible water contamination and who might be at risk. The risk map will be available to the public on the department's website and will consider potential burdens on disproportionately impacted communities.
- In the fall of 2019, the department conducted a survey of fire departments on their inventory, use and disposal of firefighting foam containing PFAS as required by House Bill 19-1279. The information gathered identifies how, where, and when the fire departments used foam for training, whether the fire departments are served by wells or public drinking water sources, and whether the fire departments have used firefighting foam containing PFAS in the last five years and where has it been used.

### Support impacted communities

- Elevated PFAS levels were discovered in three large public water systems of El Paso County in 2016, as a result of testing performed under the EPA's Third Unregulated Contaminant Monitoring Rule (UCMR 3). Upon learning about this situation, the department established a partnership with impacted water systems, the local health department, universities, EPA, and the Air Force to coordinate activities including public communications and meetings, providing impacted residents with bottled water and water bottle fill stations, and installing mitigation measures for the continued removal of PFAS at drinking water systems and private wells. The installed treatment systems continue to be sampled and maintained by the Air Force. Since 2017, PFAS levels in tap water have been below EPA's health advisory for all the community water systems. The Air Force is currently in the process of determining the extent of the PFAS contamination and pilot studies to test new and innovative groundwater and soil cleanup technologies for PFAS, in coordination with the department.
- In the summer of 2021, the Centers for Disease Control and Prevention (CDC) and ATSDR in partnership with the department completed an exposure assessment of people living near Peterson Air Force Base in El Paso County, Colorado. A team tested 346 people, including 28 children. Eighteen people also provided household samples, including tap water. Initial results showed three chemicals (PFHxS, PFOS, and PFOA) in blood were above national averages. Results for four other chemicals (PFNA, MeFOSAA, PFUnA, and PFDA) were similar to or below national averages. Urine sample results showed very low concentrations of these chemicals. Levels of PFAS chemicals in all 18 tap water samples were below all federal and applicable state guidelines for PFAS chemicals in drinking water.
- In 2019, after fire districts in Boulder County found high levels of PFAS in their wells, the department partnered with the local health department and EPA to hold community meetings and provide testing to potentially impacted private wells.
- The department is in the process of developing and administering a grant program to support community efforts in identifying and mitigating the environmental impacts of PFAS as part of Senate Bill 20-218.

# Direct potable reuse

The state of Colorado expects to double its population by the year 2050, adding to demands on the state's precious resource (water). A possible response in some communities could be direct potable reuse (DPR). Many drinking water systems pull water downstream from locations where wastewater plants release treated wastewater. But the DPR process takes the treated wastewater directly and doesn't include water from a stream, which is considered an environmental buffer, and instead treats the discharged wastewater directly. This could be part of the long-term planning for a community, but could also be something developed in response to a crisis caused by drought. At

present, DPR is not prohibited in Colorado, and therefore allowed. There are no federal regulations beyond the standard Safe Drinking Water Act (Act) that govern DPR, though the Act was not designed specifically for source water that constitutes a significant portion of treated wastewater. There are no state regulations regarding DPR either. The division believes that DPR can be done safely, and is working to ensure that it is done safely and not undertaken in a manner that jeopardizes public health.

In March 2021, the division launched a stakeholder process to develop a regulatory framework including regulations, policies and guidance for DPR. Setting minimum requirements and oversight for DPR ensures consistency and helps ensure thorough public outreach. Regulated entities requested that the division begin developing a DPR-specific rule through an engagement process. The addition of a DPR rule will allow water systems across the state to partner with CDPHE to properly plan and communicate with their public about what is needed to safely accomplish DPR. In fact, stakeholders have been active in helping to develop the appropriate background for a Colorado DPR Rule. They have supported the development of a key guidelines document authored by the National Water Research Institute and an independent panel of national experts (December 2019).

The division maintains a <u>Stakeholder webpage</u> devoted to this stakeholder process. Interested parties can sign up to participate. The Safe Drinking Water Program publishes a regular drinking water blog called Aqua Talk. The <u>Aqua Talk home page</u> provides access to the blog and historical content. Two articles regarding DPR can be accessed at the links below:

- November 2020 Aqua Talk Article
- March 2021 Aqua Talk Article

# Response to wildfires in Colorado

Prior to 2002, Colorado's recorded wildfires never exceeded 100,000 acres. Since the Hayman fire in 2002 (137,760 acres), Colorado has had five wildfires exceeding 100,000 acres (*i.e.* West Fork Complex in 2013, Spring Creek fire in 2018, and the Pine Gulch, Cameron Peak and East Troublesome fires in 2020). Colorado's unprecedented wildfire season in 2020 resulted in the three largest wildfires in Colorado's recorded history and burned over 625,000 acres across two basins. It affected over 140 public drinking water systems and 30 wastewater systems, leading to an unusually high level of short- and long-term support provided by the division.

The division supported local communities affected by wildfires by providing over \$900,000 for projects, as well as technical assistance, in order to address post-wildfire nonpoint source water quality, flooding and infrastructure impacts. The department, in coordination with volunteers from more than a dozen municipalities, state and federal agencies, water providers, watershed organizations, and consultants, developed a playbook that serves as an actionable worksheet for counties, tribes, municipalities, and water providers and includes specific and critical steps to take and contacts to make before, during, and within the first 30-days after a fire. Since its release in 2020, three local recovery groups are using the playbook for recovery efforts.

The division is better connected to wildfire emergency response efforts than ever before. The division joined the Watershed Wildfire Protection Group and partnered with Utah to evaluate potential impacts to the Colorado River. These external partnerships assist our work with communities to identify potential problem areas for future fires, mitigate further erosion of burn areas, reduce runoff, and lessen the chance of flooding.

# Part A. Introduction

The Federal Clean Water Act requires states to report on the quality of the nation's waters. These requirements are found in Sections 305(b), 303(d), and 314 of the Clean Water Act. Section 305(b) requires a comprehensive biennial report, including the status of publicly owned lakes (Section 314), and Section 303(d) requires a list of waterbodies that do not meet water quality standards. States submit a single report (the Integrated Report) to the EPA that satisfies these reporting requirements of the Clean Water Act. The EPA then compiles the data from the state reports, summarizes them, and transmits the summaries to Congress - along with an analysis of the quality of the waters nationwide. More information can be found at:

https://www.epa.gov/tmdl/integrated-reporting-guidance-under-cwa-sections-303d-305b-and-314.

The reporting requirements and components of the IR are further described within this section.

# Clean Water Act Section 305(b) reporting requirements

Section 305(b) of the Clean Water Act requires that each state submit a biennial report to the EPA. This 305(b) process is the principle means by which the EPA, Congress, and the public evaluate whether waters meet water quality standards, the progress made in maintaining and restoring water quality, and the extent of remaining problems. Each 305(b) report will contain, at least, the following:

- A description of the water quality of all waters in the state and the extent to which the quality of waters provides for the protection and propagation of a balanced population of shellfish, fish, and wildlife and allows recreational activities in and on the water.
- An estimate of the extent to which Clean Water Act control programs have improved water quality or will
  improve water quality, recommendations for future actions necessary, and identifications of waters
  needing action.
- An estimate of the environmental, economic, and social costs and benefits needed to achieve the objectives of the Clean Water Act with an estimate of the date of such achievement.
- A description of the nature and extent of nonpoint source pollution and recommendations of programs needed to control each category of nonpoint sources, including an estimate of implementation costs.
- An assessment of the water quality of all publicly owned lakes, including the status of such water quality as specified in Section 314(a)(1) of the Clean Water Act.

# Clean Water Act Section 303(d) reporting requirements

The 1972 amendments to the Clean Water Act include the addition of Section 303(d). The regulations implementing Section 303(d) require states to develop lists of waterbodies that do not meet water quality standards and to submit updated lists to the EPA every two years, along with the 305(b) Integrated Report. Water quality standards, as defined in the Code of Federal Regulations, include classified uses, water quality objectives (narrative and numerical), and antidegradation requirements. The EPA is required to review impaired waterbody lists submitted by each state and approve or disapprove all or part of the list.

For waterbodies on the 303(d) List, the Clean Water Act requires that a pollutant load reduction assessment or Total Maximum Daily Load (TMDL) be developed to correct the impairment. The TMDLs must document the nature of the water quality impairment, determine the maximum amount of a pollutant which can be discharged and still meet standards, and identify allowable loads from the contributing sources. The elements of a TMDL include a problem statement, description of the desired future condition (numerical target), pollution source analysis, load allocation, description of how allocations relate to meeting targets, and margins of safety. More information can be found at <a href="https://www.epa.gov/tmdl">www.epa.gov/tmdl</a>.

Each 303(d) List incorporated into the IR contains the following information:

- A list of water quality limited waters still requiring TMDLs, pollutants causing the impairment, and priority ranking for TMDL development
- A description of the methodology used to develop the list
- A description of the data and information used to identify water quality, including a description of the
  existing and readily available data and information used
- A rationale for any decision to not use existing and readily available data and information
- Any other reasonable information requested by the EPA, such as demonstrating good cause for not including a water or waters on the list

# Clean Water Act Section 314 reporting requirements

Each 305(b) report submission must include an assessment of the status of significant publicly owned lakes including extent of point source and nonpoint source impacts due to toxics, conventional pollutants, and acidification.

# Integrated reporting guidance

The data historically reported as the 305(b) report is now reported electronically in the Assessment and Total Maximum Daily Load Tracking and Implementation System (ATTAINS) database. This data includes the physical description, the classified uses, and attainment conclusion of every waterbody in the state. ATTAINS also requires the reporting of all TMDLs, 303(d) List of Impaired Waters (Regulation 93), and the spatial coverage of all state waters.

The IR is intended to provide an effective tool for maintaining high-quality waters and improving the quality of waters that do not attain water quality standards. The IR also provides water resources managers and citizens with detailed information regarding the following:

- Progress towards achieving comprehensive assessment of all waters
- Water quality standards attainment status
- Methods used to assess water quality standards attainment status
- Additional monitoring needs and schedules
- Pollutants and waterbodies requiring TMDLs
- Pollutants and waterbodies requiring alternative pollution control measures
- Management strategies (including TMDLs) under development to attain water quality standards
- TMDL development schedules and goals

The IR streamlines water quality reporting because data sources and assessment methods are described in detail in Colorado's Section 303(d) Listing Methodology, which provides a sound technical and scientific basis for assessment and listing decisions. Public participation events provide opportunities for data submission and discussion of water quality assessment methods and results. The listing methodology is reviewed and updated on a biennial basis in anticipation of the IR development. The listing methodology is revisited and revised with the intent of clarifying the division's procedures for assessing attainment of those uses and standards assigned by the commission. The current listing methodology can be found at: <a href="https://www.colorado.gov/cdphe/wqcc-reports-and-plans">www.colorado.gov/cdphe/wqcc-reports-and-plans</a>.

# Integrated reporting categories

Waterbodies are assessed and divided into one of five reporting categories. In Colorado, the majority of waterbodies fall into IR Categories 1, 5, 3b, and 3a. Segments that attain water quality standards fall into one of two subcategories - 1a (attaining) or 1b (attaining with an approved TMDL). In some cases, a complete assessment of all uses cannot be completed due to a lack of data, but the available data indicate that at least some of the assessed uses are fully supported. An example would be instances where an aquatic life assessment has been completed but analytical results to assess water supply uses were not available. These segments would fall into Category 2. Colorado places segments that lack conclusive evidence regarding attainment of standards on the Monitoring and Evaluation List, which falls into Colorado's subcategory 3b. IR Category 3a includes those waterbodies that have not been assessed or for which no data exists. Segments for which an EPA-approved TMDL has been completed are placed in IR Category 4a. In some cases, segments previously classified as IR Category 4a have been re-assessed and placed into Colorado's subcategory 1b, as they are now in attainment of all classified uses with an approved TMDL. Category 4b includes segments where water is impaired but a TMDL is not needed because other mechanisms are expected to result in the attainment of water quality standards in a reasonable period of time. Colorado's 2022 Section 303(d) List of Impaired Waters (Regulation 93), is included in Appendix D.

The 303(d) List tabulates all segments that require a TMDL and are classified as IR Category 5. A description of Colorado's categories are included below.

### • Category 1: All classified uses are supported

Waterbodies in this category are attaining water quality standards when assessed using associated assessment methodologies. Sufficient data and information exist to determine that all applicable water quality standards are being attained. Category 1 is further broken out into 2 new subcategories:

- Category 1a: Attaining water quality standards.
   Segments placed in Category 1a are in attainment of water quality standards.
- Category 1b: Attaining water quality standards (with an approved TMDL).
   Segments placed in Category 1b are in attainment of water quality standards with an approved TMDL.

Colorado created these two new subcategories to distinguish between waterbodies attaining standards with and without approved TMDLs. This distinction is important because even after a waterbody is reclassified for a given analyte from Category 4a (TMDL completed) to Category 1 (attaining), the TMDL remains in effect.

• Category 2: Available data and/or information indicate that some but not all of the classified uses are supported.

Waterbodies in this category are characterized by data and information which meet the requirements to support a determination that some, but not all, uses are attaining. Attainment status of the remaining uses is unknown because insufficient data or information are available. An example of a Category 2 waterbody would be a segment where the aquatic life and agriculture uses were both assessed and both attaining, but *E. coli* data was lacking in order to assess the recreation use. In this case it is not known if the recreation use is being attained, so the segment cannot be placed in Category 1.

- Category 3: There is insufficient available data and/or information to make a use support determination. Waterbodies in this category are listed as having insufficient data or information to support an attainment determination for any classified use. Assessment of the attainment status requires supplementary data and monitoring as needed and prioritized. Category 3 is further broken out into 2 additional subcategories:
  - Category 3a: No water quality data.
     Segments where no water quality data has been collected are placed in Category 3a.
  - Category 3b: Monitoring and Evaluation List.
     Colorado created subcategory 3b for placing segments on the Monitoring and Evaluation List (M&E).
     Waterbodies in this category indicate that there may be an impairment, but there is not enough data to put it on the 303(d) List. A segment remains on the M&E List until additional data can be collected to either add it to the 303(d) List (Category 5) or place it into Category 1a.
- Category 4: Available data and/or information indicate that at least one classified use is not being supported, but a TMDL is not needed.

Segments are placed in Category 4 if available data and/or information indicate that at least one classified use is not being supported, but a TMDL is not needed. Category 4 is further broken out into 3 additional subcategories:

Category 4a: TMDL has been completed.
 A state-developed TMDL has been approved by the EPA or a TMDL has been established by the EPA for any segment-pollutant combination. The waterbody is expected to result in full attainment of the standard once

implementation of the TMDL is complete. Where more than one pollutant is associated with the impairment of a waterbody, the waterbody will remain in Category 5 until all TMDLs for each pollutant have been completed and approved by the EPA. Monitoring shall be scheduled for these waterbodies to verify that the water quality standard is met when the TMDL is implemented.

 Category 4b: Other pollution control requirements are reasonably expected to result in the attainment of the water quality standard in the near future.

Alternative pollution control plans may prevent the need for a TMDL. Segments are not required to be included on the Section 303(d) List if the following are stringent enough to implement applicable water quality standards (see 40 CFR 130.7(b)(1)) within a reasonable period of time: technology-based effluent limitations required by the Clean Water Act; more stringent effluent limitations required by state, local, or federal authority; or "other pollution control requirements (e.g., BMPs) required by local, state or federal authority." For some water quality impaired segments, an alternative plan instead of TMDLs (referred to as a "4b alternative") may be the most effective method for achieving water quality standards. Monitoring shall be scheduled for these waterbodies to verify that the water quality standard is attained as expected.

## o Category 4c: Impairment is not caused by a pollutant.

The non-attainment of any applicable water quality standard for a segment is the result of pollution and is not caused by a pollutant. These segments do not require the development of a TMDL. Pollution, as defined by the Clean Water Act is "the man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water" (Section 502(19)), whereas pollutants are "dredged spoil, solid waste,

incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water" (Section 502(6)). In some cases, the pollution is caused by the presence of a pollutant, and a TMDL is required. In other cases, pollution does not result from a pollutant, and a TMDL is not required. States should schedule these segments for monitoring to confirm that there continues to be no pollutant associated with the failure to meet the water quality standard and to support water quality management actions necessary to address the cause(s) of the impairment. Examples of circumstances where an impaired segment may be placed in Category 4c include segments impaired solely due to lack of adequate flow or stream channelization.

• Category 5: Available data and/or information indicate that at least one classified use is not being supported and a TMDL is needed.

Segments must be placed in Category 5 when, based on existing and readily available data and/or information, technology-based effluent limitations, more stringent effluent limitations, and other pollution control requirements are not sufficient to implement an applicable water quality standard and a TMDL is needed. This category constitutes the Section 303(d) List of waters impaired by a pollutant. When more than one pollutant is associated with the impairment of a single waterbody, the waterbody will remain in Category 5 until TMDLs for all pollutants have been completed and approved by the EPA. Monitoring schedules shall be established for data collection to support TMDL development and to determine if the standard is attained. A schedule is developed for TMDLs for all waters in Category 5. The schedule considers the priority ranking of the listed waters and is submitted to the EPA.

• Category 5-alt: Alternative restoration approaches for Clean Water Act 303(d) listed waters. In accordance with the EPA's recently developed 303(d) program vision, the EPA recognizes that "under certain circumstances there are alternative restoration approaches that may be more practicable to achieve water quality standards than pursuing the TMDL approach in the near future. An alternative restoration approach is a plan, or description of actions, with a schedule and milestones, pursued in the near-term that together are expected to achieve water quality standards more rapidly." Since waters with alternative approaches remain on the 303(d) List until the standards are attaining or a TMDL has been approved, the EPA created subcategory 5-alt to track waters with alternative approaches.

# Delisting tables

In an effort to report progress of Clean Water Act programs, including progress in restoring waters, the EPA strongly encourages states to document the status of segments that have been removed from Category 5 (303(d) listed streams). To provide a complete picture of restoration, the EPA also asks states to capture the reasons for moving waters from Categories 4a, 4b, and 4c to other categories. Below is the list of reasons for removing waterbodies from the 303(d) List.

- State determines the water quality standard is being met
- Category 4b alternative plan (4b) is developed
- Non-attainment not caused by a pollutant (4c)
- TMDL approved or established by the EPA (4a)
- Waterbody is not in the state's jurisdiction
- Applicable water quality standards attained due to restoration activities
- Applicable water quality standards attained due to changes in standards
- Applicable water quality standards attained according to a new assessment method
- Applicable water quality standard attained; the reason for recovery is unspecified
- Applicable water quality standard attained; the original basis for listing was incorrect
- Data and/or information is lacking to determine water quality status; (Category 3)

The delisting table for 2022 is included in Appendix C.

# Public participation process

Colorado has an extensive public participation process associated with the development of the Integrated Report that is informative and open. In addition to the public processes in place for updating the 303(d) Listing Methodology and the 303(d) List of Impaired Waters, a process is also in place for revising the 305(b) portion of the Integrated Report. The public process for the development of the 2022 Integrated Report is summarized below.

# 303(d) Listing Methodology

The revised draft 2022 Section 303(d) Listing Methodology was available for public comment in April 2020 and then approved by the commission at the administrative action hearing on May 11, 2020. The division typically leads a stakeholder workgroup to solicit feedback when revising the Listing Methodology. However, a shift in the administrative action hearing by the commission to an earlier date did not allow sufficient time to convene the

<sup>&</sup>lt;sup>1</sup> 2016 Integrated Report Guidance, EPA, www.epa.gov/sites/production/files/2015-10/documents/2016-ir-memo-and-cover-memo-8\_13\_2015.pdf

workgroup for this listing cycle. The commission considered all public comments received and encouraged public participation at the administrative action hearing.

## Water quality data call

The division solicited water quality data from June 15, 2020, to September 15, 2020. Over 1,000 stakeholders were invited to participate in the data call. The division received physical, chemical, and biological data from more than 40 organizations, including the USGS, River Watch, municipal, private entities, and data collected by the division. Data records for approximately 1,100 individual stations were submitted by the organizations listed above. The period of record for data collected in the basin of focus (San Juan and Dolores River Basins (Regulation 34), and the Gunnison and Lower Dolores River Basins (Regulation 35)) was from 1/1/2015 to 12/31/2019. Additional water quality data was also submitted where there were outstanding issues statewide.

## 303(d) List of Impaired Waters (Regulation 93)

The division encouraged public participation during the rulemaking process for the adoption of the Section 303(d) List of Impaired Waters (Regulation 93). The public was formally notified of a 28-day public comment period from February 25, 2021, to March 24, 2021. In addition, informal meetings and discussions between the public and the division occurred at any time during the rulemaking process. After receiving comments from the public, the division either revised the 303(d) List of Impaired Waters or addressed the comments in written rebuttal statements. The commission considered all public comments and adopted the 2022 Section 303(d) List of Impaired Waters (Regulation 93) at the May 10, 2021, public rulemaking hearing.

## 305(b) portion of the Integrated Report

The division provided a 29-day public comment period for the draft 305(b) portion of the Integrated Report. The draft 305(b) report was available for public comment on the commission's website from September 1, 2021, to September 29, 2021, and then approved by the commission at an administrative action hearing on October 12, 2021.

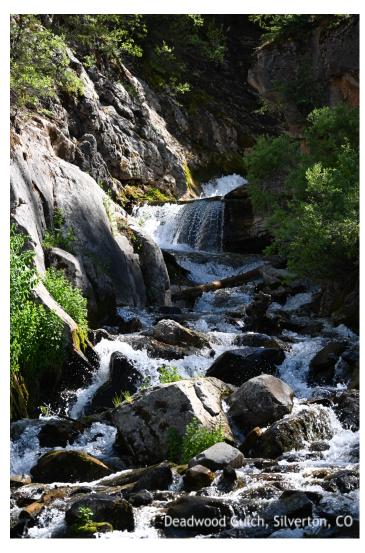

# Part B. Background and use support summary

This section provides an overview of Colorado's surface water and a water quality status summary. We discuss assessment results for individual basins in Part F of this report. A comprehensive waterbody category list is available in Appendix A and B: Use Attainment Table for Streams and Lakes.

# **Background**

In Colorado, there are over 90,000 miles of rivers and more than 270,000 acres of lakes<sup>2</sup>. The majority of rivers originate in the pristine, high alpine environment of the Rocky Mountains and flow downstream through the high desert or high plains regions before leaving the state. The exceptions are the Green River and the Little Snake River, which flow into the northwest corner of the state, for only short stretches. There are several high, broad basins in the interior of the Rocky Mountains. In the north, on the east side of the Continental Divide is North Park. North Park is drained by the North Platte River, which flows north into Wyoming. Middle Park is just south and west of the Continental Divide and is drained by the Colorado River. South Park is the headwaters of the South Platte River. To the south lies the San Luis Valley and the headwaters of the Rio Grande, which drains into New Mexico. Portions of central Colorado and the southeastern portion of the state are drained by the Arkansas River. The Western Slope is generally drained by the Colorado River and its tributaries.

Nearly half of the state is flat. The Colorado High Plains, which are part of the Great Plains, lie east of the southern Rocky Mountains. They are sparsely populated, with most people living along the South Platte and Arkansas Rivers.

Numerous dams and reclamation projects on the rivers supply hydroelectric power and provide water for irrigation and municipal and industrial use. The Colorado-Big Thompson and the Fryingpan-Arkansas projects are two of the largest. They divert water from the Western Slope, which has 80 percent of the state's surface water, to the Eastern Slope, where most of the population and farmland are concentrated.

<sup>&</sup>lt;sup>2</sup> Calculations are based on Colorado's GIS data version of the National Hydrography Dataset at 1:100,000 resolution.

There are seven major river basins in Colorado: Arkansas, Rio Grande, San Juan, Colorado, Green/Yampa/White, South Platte, and Republican. The largest of these basins on a national level is the Colorado River Basin, which has its headwaters in Rocky Mountain National Park, flows from Colorado through Utah and the Grand Canyon in Arizona, and ultimately completes its journey at the Gulf of California. The commission further divides these river basins into seven water quality standard regulated basins: Arkansas, Upper Colorado and North Platte, San Juan and Dolores, Gunnison and Lower Dolores, Rio Grande, Lower Colorado, and South Platte. Part F of this report covers each of these basins in more detail.

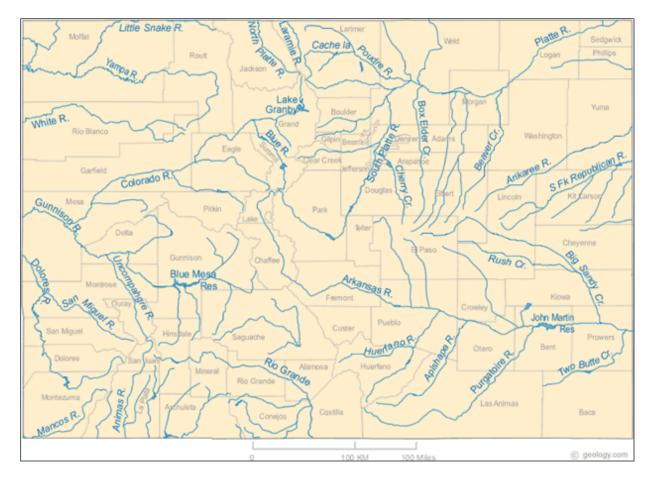

Figure 5. Map from <a href="www.geology.com">www.geology.com</a> shows the major rivers and streams of Colorado. Colorado has a total of 104,100 square miles of surface area, with only 371 square miles covered by water.

# Use support summary

The commission has adopted five different categories of classified waterbody uses:

- Agriculture
- Aquatic Life
  - Class 1 Cold Water Aquatic Life

These are waters that (1) currently are capable of sustaining a wide variety of cold water biota, including sensitive species, or (2) could sustain such biota but for correctable water quality conditions. Waters shall be considered capable of sustaining such biota where physical habitat, water flows or levels, and water quality conditions result in no substantial impairment of the abundance and diversity of species.

## o Class 1 - Warm Water Aquatic Life

These are waters that (1) currently are capable of sustaining a wide variety of warm water biota, including sensitive species, or (2) could sustain such biota but for correctable water quality conditions. Waters shall be considered capable of sustaining such biota where physical habitat, water flows or levels, and water quality conditions result in no substantial impairment of the abundance and diversity of species.

### o Class 2 - Cold and Warm Water Aquatic Life

These are waters that are not capable of sustaining a wide variety of cold or warm water biota, including sensitive species, due to physical habitat, water flows or levels, or uncorrectable water quality conditions that result in substantial impairment of the abundance and diversity of species.

### Domestic Water Supply

#### Recreation

### Class E - Existing Primary Contact Use

These surface waters are used for primary contact recreation or have been used for such activities since November 28, 1975.

### Class P - Potential Primary Contact Use

These surface waters have the potential to be used for primary contact recreation.

### ○ Class N - Not Primary Contact Use

These surface waters are not suitable or intended to become suitable for primary contact recreation uses.

### Class U - Undetermined Use

These are surface waters whose quality is to be protected at the same level as existing primary contact use waters, but for which there has not been a reasonable level of inquiry about existing recreational uses and no recreation use attainability analysis has been completed.

#### Wetlands

Table 5, Summary of classified uses, breaks down the number of stream miles and lake acres in the state that have been assigned each of these classified uses. Many segments support multiple uses. The numbers included in Table 5 are higher than the numbers included in the attainment summary tables above because they include a summary of all streams and lakes in the state. The tables above only included the numbers of miles and acres assessed for streams and lakes.

Table 5. Summary of classified uses

Classified Use	Rivers & Streams (miles)	Lakes & Reservoirs (acres)
Agriculture	91,389	271,436
Aquatic life cold 1	37,538	120,065
Aquatic life cold 2	6,321	1,743
Aquatic life warm 1	6,404	92,940
Aquatic life warm 2	40,449	56,697
Domestic water supply	69,271	250,324
Recreation, primary contact (Classes E, P & U)	74,446	261,402
Recreation, secondary contact (Class N)	16,964	10,043

# Summary of waterbodies meeting classified uses

The Clean Water Act Section 101(a)(2) requires that all waters be suitable for the protection and propagation of fish, shellfish, and wildlife and for recreation in and on the water unless it is demonstrated that the use is not attainable. Classified uses are assigned to waterbodies based upon the actual uses occurring in the waterbody. Water quality standards are in place to ensure that the waterbody is attaining the assigned classified uses. The following tables (Tables 6 and 7) summarize the number of stream miles and lake acres that have been assessed, which do or do not support their assigned classified uses.

Table 6. Attainment of classified uses as estimated miles of rivers and streams

Classified Use	Fully Supporting	Not Supporting	Insufficient Data (M&E)	Not Assessed
Agriculture	84,444	688	53	6,205
Aquatic life cold 1	26,923	4,263	3,980	2,372
Aquatic life cold 2	4,443	466	492	920
Aquatic life warm 1	3,107	2,537	528	232
Aquatic life warm 2	33,920	3,092	1,005	2,433
Domestic water supply	35,073	20,790	7,282	6,127
Primary recreation	63,965	2,038	2,932	5,511
Secondary recreation	14,738	390	200	1,635

Table 7. Attainment of classified uses as estimated acres of lakes and reservoirs

Classified Use	Fully Supporting	Not Supporting	Insufficient Data (M&E)	Not Assessed
Agriculture	178,798	0	0	92,639
Aquatic life cold 1	67,744	31,545	3,379	17,397
Aquatic life cold 2	223	448	0	1,072
Aquatic life warm 1	21,159	41,105	1,431	29,244
Aquatic life warm 2	18,892	4,557	0	33,249
Domestic water supply	116,548	44,300	14,919	74,556
Primary recreation	173,904	0	6	87,493
Secondary recreation	1,902	0	0	8,141

## Detailed summaries of waterbodies meeting classified uses

The following graphs (Figures 6 and 7) are the result of the monitoring and assessments efforts for the 2022 IR.

## For rivers and streams:

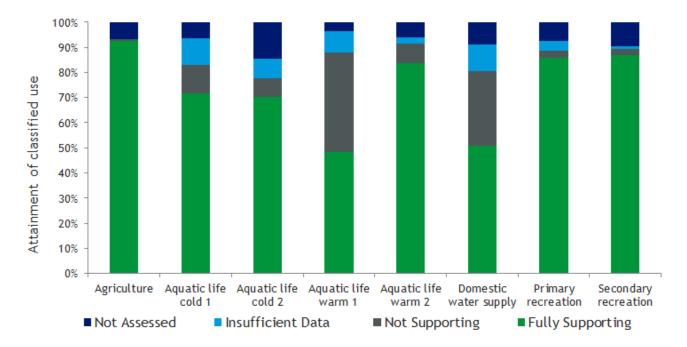

Figure 6. Attainment of classified uses for Colorado's rivers and streams.

## For lakes and reservoirs:

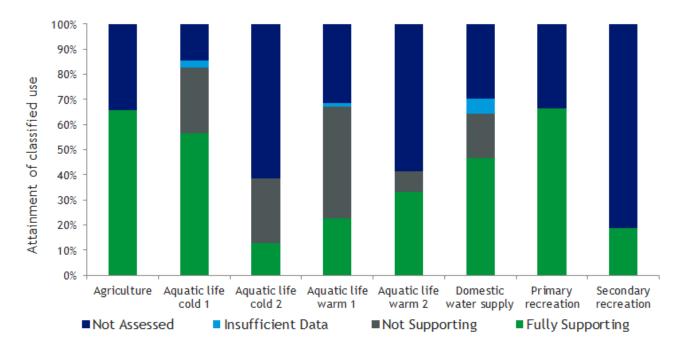

Figure 7. Attainment of classified uses for Colorado's lakes and reservoirs.

## Causes affecting use attainability

In Colorado, when a narrative or numeric standard is exceeded, we determine that the associated use is in non-attainment and then determine the cause or the pollutant contributing to the non-attainment. For example, if the aquatic life use standard for zinc is exceeded, then the aquatic life use would be in non-attainment and the cause would be zinc.

This section presents the primary causes of impairments for the 2022 listing cycle in two different ways; for rivers and lakes separately, and rivers and lakes combined.

### For rivers and streams

The most common causes of impairments for rivers and streams in the 2022 listing cycle were arsenic, manganese, total recoverable iron, *E. coli*, and selenium. The primary cause for non-attainment of the aquatic life use was total recoverable iron; for non-attainment of the water supply use, arsenic; and for non-attainment of the recreation use, *E. coli*. Standards associated with agricultural use are typically less stringent compared to standards protective of both aquatic life and water supply uses. Therefore, non-attainment of the agricultural use alone is not common; only four impairments of the agricultural use were reported for the 2022 listing cycle, two each for copper and selenium.

### For lakes and reservoirs

The primary causes of impairments for lakes and reservoirs in the 2022 listing cycle were arsenic, dissolved oxygen, fish tissue mercury, temperature, and pH. The primary cause for non-attainment of the aquatic life use was dissolved oxygen. For the assessment of water supply use, arsenic was the most common cause of impairment in lakes and reservoirs.

## For rivers/streams and lakes/reservoirs

The three most common causes affecting streams and lake impairments are arsenic, manganese, and temperature. Figure 8 summarizes the causes contributing to non-attainment of uses for assessed waters by assessment units.

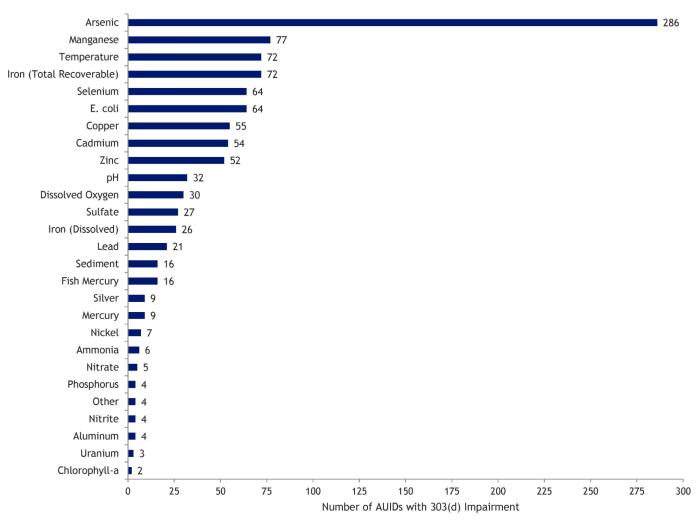

Figure 8. Summary of causes contributing to non-attainment of uses for Colorado's assessed waters.

The three most common causes contributing to non-attainment of uses for rivers and streams in terms of miles are manganese, arsenic, and sulfate. For lakes, the most common causes contributing to non-attainment of uses in terms of acres are arsenic, selenium, and temperature. Table 8 summarizes the size (miles/acres) of impairments for each cause.

Table 8. Summary of causes affecting waterbodies that are not supporting classified uses

Category	Cause	Affected rivers & streams (miles)	Affected lakes & reservoirs (acres)
	dissolved oxygen	419	10,482
Dhysical	рН	451	8,179
Physical	sediment	529	0
	temperature	1,278	22,168
	E. coli	2,429	0
Piological	chlorophyll-a	0	974
Biological	fish mercury	0	17,739
	aquatic life (macroinvertebrates)	1,827	0
	ammonia	691	538
	nitrate	131	0
Inorganics	nitrite	28	0
	phosphorus	67	451
	sulfate	9,942	0
	aluminum	119	0
	copper	1,298	861
	cadmium	885	0
	iron (dissolved)	457	1,553
	iron (total recoverable)	1,892	826
Metals	lead	238	255
metats	manganese	10,911	422
	mercury	364	0
	nickel	20	0
	silver	411	0
	uranium	379	0
	zinc	1,243	0
	selenium	4,613	32,225
Other elements	arsenic	10,106	44,015
	other	21	0

# Waterbody identification and category support tables

The tables in the appendices display assessment conclusions for individual stream and lake segments. The following table (Table 9) provides an explanation of the waterbody identification system used in Colorado. Additionally, the table groups basins by regulation number.

Table 9. Key to identifying the major and minor river basins in waterbody identification codes (WBID)

Regulation Number		Letters 3-4 = major river basin		Letters 5-6 = minor river basin
			UA	Upper Arkansas River
			MA	Middle Arkansas River
32	AR	Arkansas River	FO	Fountain Creek
			LA	Lower Arkansas River
			CI	Cimarron River
			UC	Upper Colorado River
			BL	Blue River
33	UC	Upper Colorado &	EA	Eagle River
33	UC	North Platte Rivers	RF	Roaring Fork River
			NP	North Platte River
			YA	Yampa River Basin
			SJ	San Juan River
			PI	Piedra River
		San Juan & (Upper)	PN	Los Pinos River
34	SJ	SJ Dolores Rivers	AF	Animas and Florida Rivers
			LP	La Plata River, Mancos River, McElmo Creek, and San Juan River in Montezuma and Dolores counties
			DO	(Upper) Dolores River
			UG	Upper Gunnison River
		Gunnison & Lower	NF	North Fork of the Gunnison River
35	GU		UN	Uncompahgre River
20	GU	Dolores Rivers	LG	Lower Gunnison River
			SM	San Miguel River
			LD	Lower Dolores River
			RG	Rio Grande
36	RG	Rio Grande	AL	Alamosa River, La Jara Creek, and Conejos Creek
			СВ	Closed Basin and San Luis Valley
			LY	Lower Yampa River
37	LC	Lower Colorado River	WH	White River
			LC	Lower Colorado River
			US	Upper South Platte River
			СН	Cherry Creek
			BE	Bear Creek
			CL	Clear Creek
			BD	Big Dry
			ВО	Boulder Creek
38	SP	South Platte River	SV	St. Vrain Creek
			MS	Middle South Platte River
			BT	Big Thompson River
			CP	Cache la Poudre River
			LA	Laramie River
			LS	Lower South Platte River
			RE	Republican River

# Part C. Water pollution control programs

# The Water Quality Control Division

The division is the primary agency responsible for maintaining, restoring, and improving the quality of Colorado's waters and for ensuring that safe drinking water is provided to the public from public water systems. The division is organized into three programs: the Clean Water Program, the Safe Drinking Water Program, and the Operations Program. The Clean Water Program consists of the watershed section, the compliance and enforcement section, and the permits section. The watershed section consists of three units and a workgroup: the environmental data unit, the monitoring and data workgroup, the standards unit, and the restoration and protection unit. The permits section consists of three units that issue permits for point source discharges to surface water and groundwater and a unit for business data services and administrative support. The compliance and enforcement section consists of two units: the clean water compliance unit and the clean water enforcement unit. The Safe Drinking Water Program consists of the compliance assurance section, the field services section, the community development and partnership section, and the engineering section. The Operations Program provides administrative support and includes the business services unit, communications and special projects unit and the fiscal services unit. An organizational chart for the division is included in Figure 11 at the end of Part E (page 75).

# Water quality monitoring

A discussion of the division's water quality monitoring, assessment, and reporting can be found in Chapter II of the Water Quality Control Commission Policy 98-2: A Guide to Colorado Water Programs for Water Quality Management and Drinking Water.<sup>3</sup> The division's activities in the last two years are summarized in the annual reports to the commission.

# Monitoring initiatives 2020 - 2021

The division conducts monitoring at a number of streams, reservoirs, and lakes around the state to determine their trophic status, develop TMDLs, and support changes to standards and classifications during triennial reviews. The division's surface water monitoring activities for state fiscal year (SFY) 2020-2021 were grouped into four general types: (1) routine sampling, (2) special studies, (3) aquatic life and habitat studies, and (4) lakes and reservoir monitoring. The majority of the division's sampling efforts were devoted to the collection of water chemistry samples from all major river basins with an emphasis on the San Juan and Gunnison River basins in SFY 2020 followed by the Arkansas and Rio Grande River basins as well as the Upper and Lower Colorado River basins in SFY 2021. River and stream sites in these basins are sampled for reviewing and developing standards for triennial water quality standards reviews, water quality assessments, developing TMDLs, Clean Water Act Section 303(d) listing determinations, and for reporting trends and water quality status in this IR (Colorado's Section 305(b) Report).

## Routine sampling

The division uses a rotating basin approach for stream monitoring. All major basins are sampled on a five-year cycle that matches the commission's schedule for triennial reviews of basin standards and classifications. For the purposes of conducting triennial reviews, the state was divided into four major river basins. Each of the four

<sup>&</sup>lt;sup>3</sup> Policy 98-2. 2020. A Guide to Colorado Water Programs for Water Quality Management and Drinking Water <a href="https://drive.google.com/file/d/18Tbk">https://drive.google.com/file/d/18Tbk</a> kKdR-PeGvlwHQDbjET8jByrqU4t/view

major river basins is sampled intensively once every five years. This allows the division to concentrate its limited resources in one basin to provide a complete set of data in preparation for the triennial review scheduled for that basin. In every fifth year of the cycle, the commission reviews Regulation 31 (Basic Standards and Methodologies for Surface Water) and there is no need to intensively sample one of the major basins. For that year, the division allocates sampling more evenly among the long-term trend sites in the four basins, conducts special studies, and may fill specific data gaps or address other data needs.

The division's monitoring budget for laboratory analysis, which was \$486,121 in SFY 2020 and \$453,624 in SFY 2021, controls the number of sites and times a site is sampled each year. The department's Laboratory Services Division analyzes the samples collected. Depending on the amount of data sought for a particular site and its accessibility, sites are visited on a regular schedule (i.e. monthly, bimonthly, or when weather and road conditions allow access).

In SFY 2020, routine water chemistry samples were collected from a network of 274 sampling sites. The San Juan and Gunnison River basins were the focus of SFY 2020. The division allocated 36 percent of the sampling in the South Platte River Basin, 16 percent in the Colorado River Basin, 14 percent in the Arkansas and Rio Grande River Basins and 34 percent in the San Juan and Gunnison River Basins. This sampling resulted in the collection of 971 sample sets.

In SFY 2021, routine water chemistry samples were collected from a network of 182 sampling sites located across the state. The Arkansas and Rio Grande River basins as well as the Upper and Lower Colorado River basins were the focus of SFY 2021. The division concentrated 24 percent of the sampling in the South Platte River Basin, 42 percent in the Upper and Lower Colorado River Basins, 26 percent in the Arkansas and Rio Grande Basins and 8 percent in the San Juan and Gunnison River Basins. This sampling resulted in the collection of 749 sample sets.

In both fiscal years, samples were analyzed for a suite of constituents including metals, inorganics, and nutrients. In SFY 2020, 178 *E. coli* samples were submitted for analysis to address many segments for ongoing TMDL activities. In SFY 2021, 230 *E. coli* samples were submitted for analysis to address multiple segments for ongoing TMDL activities and segments on the M&E List. Field parameters such as dissolved oxygen, pH, conductance, and temperature were also collected.

## **Special studies**

In addition to routine sampling, the division conducted a variety of special studies and monitoring efforts. Special studies included macroinvertebrate studies, fish tissue studies, temperature monitoring, selenium speciation and arsenic studies, studies to support TMDL development, and studies to evaluate nonpoint source project work.

#### Macroinvertebrate studies

During the summers of 2019 and 2020, the division conducted macroinvertebrate sampling to address multiple issues, such as M&E and 303(d) listed waterbodies, scoping new sediment regions, high quality waters, site-specific standards and trend analysis. A total of 175 macroinvertebrate samples were collected over the two summers.

In the summer of 2019, the division supported the collection of 8 macroinvertebrate samples in the South Fork of the South Platte River, 4 macroinvertebrate samples on Rock Creek near Jefferson, Colorado to support U.S. Forest Service activities, 13 macroinvertebrate samples in the Hermosa Creek region to evaluate post-416 Fire conditions, and 8 samples on the Colorado River to support Colorado Parks & Wildlife activities.

Fish collected from 10 lake sites across Colorado were sampled and tested for the presence of mercury from July 1, 2019 through June 30, 2021 (SFY 2020 - SFY 2021). This effort resulted in 217 composite tissue samples for analysis by the department's Laboratory Services Division. Of the waterbodies tested in SFY 2020 through SFY 2021, one new 303(d) listing was warranted. As of June 30, 2021, there are a total of 19 impaired waters due to fish tissue mercury.

See the fish consumption advisory section (page 67) for additional information regarding fish tissue sampling and the fish consumption advisory program.

### Temperature sampling

From SFY 2020 to SFY 2021, stream temperature data was collected from 24 monitoring sites located throughout the state. The temperature monitoring program focused roughly 40 percent of the monitoring efforts in the South Platte River Basin and roughly 60 percent in the remaining three major basins.

#### TMDL development

From SFY 2020 to SFY 2021, 54 water chemistries and flows were collected from 22 monitoring sites located primarily in the Lower Colorado River, the Arkansas River, and the Clear Creek sub-basin.

See the identification of restoration approaches section (page 58) for additional information regarding monitoring to support TMDL development.

### Selenium speciation and arsenic

From SFY 2020 to SFY 2021, 13 selenium speciation (also colloquially known as the selenium trophic transfer study) samples were collected from 11 monitoring sites to examine selenium concentrations in water, sediment, or benthic macroinvertebrates. Planned activities were limited due to the COVID-19 pandemic.

## Aquatic life and habitat studies

In SFY 2020, the division collected macroinvertebrate and habitat samples at 42 sites across the state, primarily within the San Juan, Gunnison, Dolores, Republican, and Arkansas River basins. At each of the habitat sites, water quality samples were taken and analyzed for a specific suite of chemical constituents. These data, plus habitat scores, periphyton samples, and occasionally substrate measurements, were used in assessment of aquatic life use and 303(d) or M&E listing decisions.

The aquatic life studies included targeted sampling of 303(d) and M&E listed stream segments, trend sites, reference site revisits, searching for candidate reference sites for

bioassessment tool refinement, nutrient criteria development, testing high quality waters for potential MMI declines, and investigating legacy mining affects in the Upper Dolores River sub-basin.

In SFY 2020, the division worked collaboratively with the Colorado Parks & Wildlife to collect macroinvertebrate data at 8 sites on the Colorado River near the Parshall/Kremmling area. The division also worked collaboratively with USFS in a small-scale study related to the Greenback Cutthroat trout reintroduction on one waterbody in the Upper South Platte basin and Mountain Studies Institute to collect macroinvertebrates in the Hermosa Creek sub-basin after the devastating summer of 2018 fire, known as the "416" fire. These combined efforts involved an additional 34 samples.

In SFY 2021, the division collected macroinvertebrate and habitat samples at 21 sites across the state, primarily in the Arkansas, Rio Grande, and Colorado River basins. The aquatic life studies included targeted sampling of 303(d) and M&E listed stream segments across multiple basins, trend sites, candidate reference site visits, and segments with high potential for aquatic life use upgrades. The division also continued a programmatic activity where water quality technicians collected 13 macroinvertebrate samples simultaneously with water chemistry samples in support of these studies.

In SFY 2021, the division only worked collaboratively with USFS in a small-scale study related to the Greenback Cutthroat trout reintroduction on one waterbody in the Upper South Platte basin. Collaboration with other external parties was limited due to the COVID-19 pandemic.

## Lake and reservoir monitoring

The division conducted lake and reservoir sampling in the South Platte, San Juan, Gunnison, Arkansas, and Rio Grande basins during the summer of 2019. Two lakes in the Gunnison basin and three lakes in the San Juan basin were sampled three times each, once each month of the growing season (July, August, and September). One lake in the San Juan basin was sampled twice during the summer of 2019. Additionally, five lakes in the Arkansas basin and three lakes in the Rio Grande basin were sampled once each during the summer of 2019 as part of a scoping year for the 2020 sampling season. Three lakes were sampled only from shore due to boat engine problems or access constraints. Lastly, fourteen lakes in the South Platte basin and four lakes in the Arkansas basin were sampled during the summer of 2019 to fill in data gaps for nutrient criteria development.

The division conducted lake and reservoir sampling in the Upper Colorado, Arkansas, Rio Grande, and South Platte basins during the summer of 2020. Due to the Covid-19 pandemic, sampling was limited to what could be accomplished during day trips. Two lakes in the Arkansas basin, two lakes in the Upper Colorado basin, and one lake in the South Platte basin were sampled three times each, once each month of the growing season (July, August, and September). One lake in the Upper Colorado basin and one lake in the Arkansas basin were sampled once each during the summer of 2020. Two lakes in the Upper Colorado basin, one lake in the South Platte basin, and one lake in the Rio Grande basin were sampled as part of an arsenic and selenium speciation study. One additional lake was sampled in the South Platte basin for gear testing purposes.

At each lake, depth profiles of dissolved oxygen, pH, conductivity, and temperature were collected at one-meter intervals. Water quality samples were taken from the top two meters from the surface and one to three meters above the bottom. Samples were analyzed for a suite of chemical parameters including nutrients, metals and inorganics. In addition, the surface sample was analyzed for the chlorophyll-a content as a measure of trophic status and for the phytoplankton population to determine the algae species composition. Secchi measurements were also taken at each lake.

The division also collects baseline cyanotoxin samples at routine lake sites and emergency samples at reported cyanoHAB bloom sites. For emergency samples at sites managed by Colorado Parks and Wildlife (CPW), the division partners with CPW for sample collection. During the summer of 2019, 30 baseline and 60 emergency cyanotoxin samples were collected from 27 lakes and reservoirs. Toxins were detected at seven lakes sampled during summer 2019. During the summer of 2020, 16 baseline and 52 emergency cyanotoxin samples were collected from 18 lakes and reservoirs and one river. Toxins were detected at ten lakes sampled in summer 2020. During May and June of 2021, three emergency cyanotoxin samples were collected from one reservoir and one river, and toxins were detected at the reservoir sampled during June of 2021. The state's toxic algae website <a href="https://cdphe.colorado.gov/toxic-algae">https://cdphe.colorado.gov/toxic-algae</a> was also redesigned in 2020 and includes general information, fact sheets, an updated toolkit for recreational waterbody managers, and caution/warning signs for waterbody managers to use. The website links to the state's new toxic algae dashboard, which the division created in conjunction with the Colorado Environmental Public Health Tracking Program. This dashboard contains historical algal toxin test results: <a href="https://bit.ly/3xmyEl5">https://bit.ly/3xmyEl5</a>.

See the Clean Lakes Program section (page 63) for additional information regarding Colorado's lake monitoring and assessment program.

## Augmented monitoring funds

To upgrade state monitoring efforts and encourage implementation of the monitoring and assessment strategies for states, the EPA makes funds available through the Clean Water Act Section 106 Monitoring and Initiative Grant Program for monitoring purposes.

Colorado has advanced the monitoring and assessment program in many ways through the monitoring and initiative grant program. These include expanded monitoring into areas previously not sampled as well as expanded monitoring to assess new methodologies to determine the health of Colorado's waters. Through this grant, Colorado has built partnerships to sample and assess lakes and streams in Colorado that would not have been sampled or assessed without additional resources.

Colorado received \$151,265 of monitoring and initiative funds in federal fiscal year (FFY) 2019 for a two-year period to facilitate the implementation of enhanced monitoring plan. These funds were used for several studies and initiatives including:

- Evaluating the levels and types of arsenic in edible fish from Colorado waters
- Collecting additional sediment, aquatic insect, and fish selenium sampling and analysis to support criteria development
- Collecting *E. coli* to identify the potential sources of elevated pathogen levels in 303(d) listed stream segments in urban areas of the South Platte River basin
- Building a comprehensive E. coli database for Waterbody Segment COSPCH03 to support TMDL development
- Expanding or replacing inventory of temperature loggers for streams/rivers in Colorado
- Developing web-accessible standard operating procedures training videos and emergency response documentation

Colorado received \$161,755 of monitoring and initiative funds from federal fiscal year (FFY) 2020 for a two-year period to facilitate the implementation of enhanced monitoring plan. These funds were used for several studies and initiatives including:

- Identification of an analytical method that results in better quantification of mercury content in surface waters
- Focused data collection at new reference sites in xeric (dry) bioregions of Western Colorado and the Rio Grande River basin
- Acquisition of a YSI EXO total algae PC digital smart sensor for measuring chlorophyll in the field
- Migration of data elements from WQX/STORET and previous division databases to Gold Systems' Ambient Water Quality Monitoring System (AWQMS)

Additionally, Colorado requested associated program support from EPA to participate in a state-scale probabilistic survey of water quality related to the National Coastal Condition Assessment in FFY19. This was effectively a formality since Colorado does not have an ocean or estuary coast. However, Colorado has chosen to participate in the FFY20 state-scale probabilistic survey of water quality related to the National Wetlands Condition Assessment. The division has subcontracted the work to the Colorado Natural Heritage Program at Colorado State University. Work began in April 2021 and will conclude in the fall of 2021. These activities will increase analyses to reach additional wetlands needed for a state-scale statistical study.

### Nonpoint source monitoring requirements

To meet nonpoint source funding requirements, project sponsors who received funds in 2019-2021 for on the ground implementation projects had to collect, in collaboration with the nonpoint source program, water quality data and/or other types of information to evaluate project-scale effectiveness of controlling nonpoint sources of pollution. The nonpoint source program relied on many types of data to help evaluate project results including aquatic macroinvertebrates population richness and diversity, indices of physical habitat integrity, and water quality chemistry. The project-scale water quality data were uploaded to the EPA Water Quality Exchange (WQX). These data also served as the basis for the nonpoint source program to report load reduction information to EPA and identify success stories that demonstrated water quality improvement from the reduction of nonpoint source pollution.

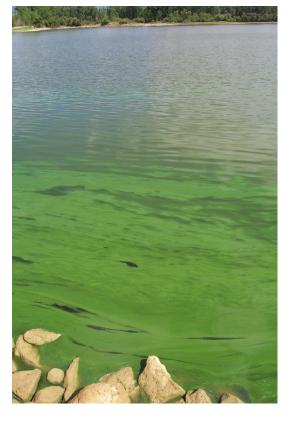

In addition to collaboration with project sponsors to demonstrate effectiveness of nonpoint source activities, the nonpoint source program continued to partner with the Natural Resources Conservation Service to evaluate the effectiveness of BMPs implemented to reduce sources of nutrients in Natural Resources Conservation Service's National Water Quality Initiative watersheds. For example, the program continued its focused work to monitor the effectiveness of nutrient BMPs implemented in the Grape and Graveyard Creek watersheds.

This monitoring to document nutrient reduction from BMP implementation was also promoted through the nonpoint source program's Regulation 85 work. The program worked with agricultural producers, Colorado State University, the Natural Resources Conservation Service, and many other partners to continue to collect data and information that will help evaluate the effectiveness of nutrient reduction practices that producers are utilizing across the state.

# 10-year water quality roadmap and nutrient management plan

Nitrogen and phosphorus are nutrients that are a part of all aquatic ecosystems. They are necessary to support the growth of the algae and aquatic plants that provide food and habitat for fish and smaller aquatic organisms. However, excess nitrogen and phosphorus—or nutrient pollution—can cause water quality problems that result in serious risks to human and animal health as well as economic harm. Too much nitrogen and phosphorus in the water causes excessive algae growth, including algae blooms that can be harmful to humans because they can produce elevated toxins and bacterial growth that can make people sick if they come into contact with polluted water, consume tainted fish or shellfish, or drink contaminated water. Algae blooms can also severely reduce or eliminate oxygen in the water, leading to illnesses or death in fish and other aquatic life.

Colorado continues to make progress to reduce nutrients throughout the state. Regulation 85, Nutrients Management Control Regulation, became effective on September 30, 2012. This control regulation establishes numerical effluent nutrient limitations for many domestic wastewater treatment plants and industrial wastewater dischargers that are likely to have

significant levels of nutrients in their discharges. It describes requirements for other point source dischargers and voluntary steps for nonpoint sources to address nutrients. The control regulation also establishes monitoring requirements for point source dischargers and a program aimed at monitoring surface waters for nutrients and related parameters. This effort is geared toward better characterizing nutrient sources and current nutrient conditions to help inform future regulatory decisions regarding nutrient management

Through a workgroup process in 2017, the division developed a nutrient monitoring plan to make progress on criteria development and memorialize Colorado's plan for continuing to make incremental progress on reducing nutrients through 2027. In October 2017, the division developed Policy 8, Colorado's 10-Year Water Quality Roadmap and Nutrient Management Plan. In 2020 and 2021, the division led a statewide Water Quality Forum workgroup to review efforts and to gain feedback on progress related to this plan.

The Colorado nutrient management plan and 10-year roadmap:

- Provides an overview of Colorado's current nutrient management framework
- Discusses plans for further reducing nutrients from point source and nonpoint sources
- Outlines the major milestones the department, commission, and stakeholders will need to achieve over the next 10 years to implement the plan
- Provides an overview of how Colorado will continue to make progress on revising nutrient standards
- Summarizes other standards development efforts through 2027. This includes cadmium, selenium, ammonia, arsenic, and temperature.
- Details plans for developing feasibility information over the next 10 years
- Establishes how the division will monitor and measure progress related to nutrients controls

## Standards development focus

In 2020 and 2021, technical advisory committees met to review temperature and lake nutrients standards. The department is collaborating with Colorado State University and Colorado Parks and Wildlife to conduct studies for both selenium and temperature.

In 2022, standards revisions will focus on the adoption of the chlorophyll-a standards for all state waters and revised standards for phosphorus and nitrogen for lakes and reservoirs for prioritized water bodies. Revised standards for phosphorus and nitrogen for rivers and streams will be considered at a rulemaking hearing in 2027, along with revised standards for ammonia and selenium.

## Nonpoint source focus

Nonpoint source program continued to expand its proactive partnership with the agricultural community to promote Regulation 85 voluntary nutrient controls, develop information and education campaigns about nutrients, and monitor nutrients to better understand the sources and effectiveness of nutrient controls. The nonpoint source program did this in partnership with Colorado State University (CSU), Colorado Department of Agriculture, and a number of local partners.

## Permits implementation focus

Effluent limits as identified in Regulation 85 will be applied to Colorado's largest domestic wastewater dischargers and some industrial dischargers until 2027. This includes domestic facilities that have a design capacity of over two million gallons per day (MGD) and that are located in high priority watersheds. High priority watersheds are those areas with a high ratio of treated wastewater flow per square mile, which encompasses the

highly urbanized areas in the Front Range and the most urbanized areas of the western slope. From 2017-2027 there is a voluntary incentive program designed to encourage point source dischargers to voluntarily reduce nutrient contributions.

## Feasibility focus

Prior to 2027, the division will work to refine and develop standards for ammonia, arsenic, cadmium, selenium, total nitrogen, total phosphorus, and temperature while developing information and tools to evaluate feasibility of treatment and appropriate implementation methods for all roadmap parameters. These resources will support facilities proposing discharger-specific variances and site-specific standards and achieving compliance with their permits. The division has already developed feasibility information related to ammonia, arsenic, selenium, and temperature. With a more defined and earlier roll-out of standards over the next ten years—and a better understanding of feasible treatment alternatives—the division expects that stakeholders will use this time to plan and develop strategies that can be implemented without delay once the standards become effective.

#### Stakeholder outreach focus

The plan includes holding a rulemaking for ammonia, selenium, and nutrients in 2027, allowing time for in-depth discussions about the criteria and its implementation. This will involve quarterly workgroup meetings for 10 years to guide the development of criteria. These quarterly meetings will ensure that planning and communication are key parts for the path forward. It is anticipated that smaller, more focused groups will be needed to help draft criteria proposals, policy documents, and the implementation framework.

### Monitoring progress

An important part of Colorado's nutrient management approach is to show continued water quality improvements as Regulation 85 and eventual changes to Regulation 31 are implemented over the next 10 years. Since 2014, to supplement the existing body of data on nutrient levels in Colorado, total phosphorus and total nitrogen were added to the routine panel assessed at all monitoring sites. In addition, facilities with design capacities greater than one MGD have been collecting both instream and effluent data. All of this data can be used to establish a baseline. To date, nutrient data from over 350 facilities have been submitted by facilities since 2014. This data is uploaded to the EPA Water Quality Exchange (WQX).

# Water quality standards

Water quality standards are established by the commission and applied to state surface waters to protect the beneficial uses. These standards are the regulatory basis for limits placed on discharges as well as the thresholds used to assess the condition of waterbodies. A discussion of the water quality standards program can be found in Part II of the Water Quality Control Commission Policy 98-2: A Guide to Colorado Water Programs for Water Quality Management and Drinking Water.<sup>5</sup>

The commission held numerous hearings to review and revise Colorado's water quality standards regulations during 2019-2021. Detailed in the following sections, these rulemaking and administrative hearings included revisions to the Basic Standards and Methodologies for Surface Water (Regulation 31), basin regulation reviews,

<sup>&</sup>lt;sup>4</sup> https://www.colorado.gov/pacific/cdphe/feasibility

<sup>&</sup>lt;sup>5</sup> Policy 98-2. 2020. A Guide to Colorado Water Programs for Water Quality Management and Drinking Water <a href="https://drive.google.com/file/d/18Tbk">https://drive.google.com/file/d/18Tbk</a> kKdR-PeGvIwHQDbjET8jByrgU4t/viewGuide-To-Colorado-Programs.pdf

site-specific issues, new criteria, discharger-specific variances, temporary modifications, and commission policies. The normal surface water standards review schedule is presented in Table 10 below.

Table 10. Surface water standards review schedule

River Basins (and Regulation Number)	Issues Scoping Informational Hearing	Issues Formulation Informational Hearing	Rulemaking Hearing
San Juan, Dolores & Gunnison (34 & 35)	October 2015	November 2016	June 2017
Arkansas & Rio Grande (32 & 36)	October 2016	November 2017	June 2018
Colorado Basin (33 & 37)	October 2017	November 2018	June 2019
South Platte (38)	October 2018	November 2019	June 2020
Basic Standards (31)	October 2019	November 2020	June 2021
Temporary Modifications (All regulations)	-	-	Biennial starting in 2020

#### Basic standards

In June 2021, the commission conducted the most recent triennial rulemaking of the Basic Standards and Methodologies for Surface Water (Regulation 31). The commission also made a number of corresponding changes in the basin regulations (Regulations 32-38) in this hearing to streamline subsequent basin hearings. These changes included:

- Temporary modifications provisions
- Discharger specific variance provisions
- Antidegradation provisions for designating waters as Use Protected
- Consideration of longevity plans for site-specific standards
- Implementation of temperature and dissolved oxygen standards for lakes
- Temperature excursions and warming events
- New criteria for acrolein and carbaryl to protect aquatic life
- Other clean-up and clarifications

## Basin regulation reviews

From 2019-2021, the standards unit conducted reviews of the Upper Colorado (Regulation 33), Lower Colorado (Regulation 37), and South Platte (Regulation 38) river basins. All use classifications, antidegradation designations, and standards were reviewed through the public rulemaking hearing process.

Revisions adopted in the 2016 triennial review of the basic standards (Regulation 31) were implemented in each basin review. Many of the issues from the basic standards review were policy issues that did not require updates of the basin regulations.

## Site-specific issues

In addition to addressing statewide issues, a number of site-specific issues were addressed, including topics such as use classification revisions and ambient-based site-specific standards. Multiple lines of evidence (e.g., fishery data, temperature data, and natural and anthropogenic pollutant source information) were reviewed in an effort

to make incremental progress refining temperature standards in sites with existing uncertainty and sites which may have attainability issues based on instream data.

The commission also adopted and reviewed discharger specific variances (DSVs) as part of the triennial review rulemaking hearings. DSVs allow a temporary water quality standard to be adopted in cases where water quality based effluent limits (WQBELs) are not feasible to achieve. Such an action maintains the long term water quality goal of fully protecting all designated uses, while temporarily authorizing an alternative effluent limit to be developed. A separate hearing was held in December 2020 to adopt DSVs for a number of small and disadvantaged communities that the division had worked with to develop variances.

### Temporary modifications

An annual temporary modifications hearing is held each December to review temporary modifications that are set to expire within the next two years. Consistent with changes adopted by the commission during the June 2021 Regulation 31 rulemaking hearing, temporary modifications rulemaking hearings will now occur on a biennial schedule (i.e., every other year) instead of on an annual basis. The next scheduled temporary modifications rulemaking hearing is in December 2022.

### 10-year water quality roadmap

The division has developed a 10-year water quality roadmap and is committed to ensuring that appropriate and protective criteria are applied to protect the beneficial uses of water in Colorado. Prior to 2027, the division will work to refine and develop standards for ammonia, arsenic, cadmium, selenium, total nitrogen, total phosphorus, and temperature while at the same time developing feasibility information to assist dischargers with proposing discharger-specific variances, site-specific standards, and achieving compliance with their permits. The division worked with a technical advisory committee to consider revised criteria for cadmium, which resulted in the adoption of statewide cadmium standards revisions in December 2019.

See the nutrients management plan section (page 36) for additional information regarding the nutrients management plan and 10-year water quality roadmap.

## Water Quality Control Commission policies

During 2020-2021, four commission policies were either approved, extended, or updated. The commission policy review schedule is presented in Table 11 below. All commission policies can be found on the <u>commission website</u>.

Table 11. Water Quality Control Commission policy review schedule

Policy No.	Policy Name	Action	Adoption Date	Expiration Date
10-1	Methodology to Determine Use Attainment for Rivers and Streams	Extension	08/10/2020	12/31/2023
17-1	Voluntary Incentive Program for Early Nutrient Reductions	New	10/13/2020	12/31/2022
20-1	Policy for Interpreting the Narrative Water Quality Standards for Per- and Polyfluoroalkyl Substances (PFAS)	New	07/14/2020	07/31/2025
98-2	A Guide to Colorado Programs for Water Quality Management and Safe Drinking Water	Updated	01/13/2020	12/31/2025

- 10-1 Methodology to Determine Use Attainment for Rivers and Streams: The purpose of this policy statement is to give the commission a "methodology for determining whether the aquatic life use is attained in rivers and streams". This policy's objective is to describe the cumulative result of regulatory actions taken by the commission. This policy also is used to assist the public and the division staff in assessing attainment of the aquatic life use and to provide a documented process that ensures assessments are conducted in a streamline manner. The policy statement was set to expire in December 2020, but the expiration date was extended, and is now set to expire on December 31, 2023.
- 17-1 Voluntary Incentive Program for Early Nutrient Reductions: This policy is intended to establish requirements for the Voluntary Incentive Program for early nutrient reductions that encourages facilities to make voluntary reductions in nutrients in exchange for an extended compliance schedule and certainty about the year in which the facility will need to meet water quality based effluent. This policy is set to expire on December 31, 2022.
- 20-1 Policy for Interpreting the Narrative Water Quality Standards for Pre- and Polyfluoroalkyl Substances (PFAS): The purpose of this policy is to interpret the narrative standard provisions in Regulation 31 (31.11(1)(a)(iv) and 41.5(A)(1)). This policy is set to expire on July 25, 2025.
- **98-2** A Guide to Colorado Programs for Water Quality Management and Safe Drinking Water: The purpose of this policy is to describe how the objectives of the Clean Water Act and the Safe Drinking Water Act are implemented in Colorado. In addition, this guide is intended to help satisfy the requirements in Section 303(e) of the federal Clean Water Act that the state maintain a water quality "continuing planning process" by describing the process currently applied in Colorado. The policy expiration date is December 31, 2025.

# Point source control program

## The regulated universe

The division implements Colorado statutes and regulations that require pollution sources to control their operations in a manner that protects the quality of Colorado's water resources and minimizes public health risks.

## Permitted sources

Permitted pollution sources are distributed among the sector-based classifications shown in Table 12. This table reflects permitted dischargers as of September 30, 2019, and does not include authorizations for sewage land application sites (biosolids and reuse).

Table 12. Total number of permits as of September 30, 2019

Permit category	Total Permits and specifics if applicable (2020 Reporting)			
Industrial and domestic discharges to surface water (process water) Permits	<ul> <li>2,024 (Some include stormwater protections)</li> <li>382 individual</li> <li>10 general</li> <li>10000 authorizations</li> </ul>			
Municipal separate storm sewer systems (MS4)	<ul> <li>59 MS4s operated by cities and counties authorized under 2 general permits</li> <li>61 MS4s operated by other governmental organizations authorized under a third general permit</li> </ul>			
Industrial stormwater	<ul><li>1002 general permits</li><li>386 no- precipitation certifications</li></ul>			
Construction stormwater	Issued when clearing, grading and excavating activities disturb one acre or more, including smaller sites as part of a larger common plan. The upward trend of construction projects continued in this reporting period.  • 5,146 permit certifications  • 1 construction stormwater discharges general permit			
Pesticides	Total unknown as this is a self-implementing permit; however, the division received reports from approximately 76 dischargers in 2019.			
Groundwater	The division issues permits authorizing discharges to groundwater from domestic sewage systems with a design capacity greater than 2,000 gallons per day.  Discharges from smaller systems are subject to county authority.  • 150 permits			
Regulation 64 Biosolids	The regulations require that application rates be based upon the nutrient requirements of the crops under cultivation. In 2019, approximately 90.5 percent of biosolids generated by municipal wastewater treatment facilities in Colorado were beneficially reused and subject to regulation under the program. Because Colorado has not been formally delegated authority to implement the federal biosolids program, the EPA retains ultimate authority over the federal program.			
Regulation 63 Pretreatment	Permits industrial user facilities that discharge to domestic sewage systems without a federally approved local pretreatment program. The regulation authorizes requirements equivalent to and more stringent than the federal program.  • 2 state-authorized pretreatment programs  • 10 permits or control mechanisms			
Regulation 84 Reclaimed water	<ul> <li>29 entities are authorized to treat and distribute reclaimed water. In 2019, these totals were reported.</li> <li>17.5 million gallons used for agricultural irrigation</li> <li>14.4 million gallons used for commercial zoo operations</li> <li>1.86 billion gallons used for industrial categories</li> <li>3.97 billion gallons used for landscape irrigation</li> </ul>			

## Sewage systems

A domestic sewage system includes the treatment plant along with the sewers, pipes, and pumps that collect and convey wastewater to the treatment plant. Colorado has hundreds of domestic systems. Many discharge large quantities compared to the flow of the stream receiving the discharge or the dilution available in the groundwater aquifer, making their pollution control practices all the more important. Sewage systems have been a major pollutant source addressed under the Colorado Water Quality Control Act since its adoption in 1973. Many reductions in pollutant loadings have been achieved but work is still needed in order to assist small systems with pollutants like ammonia and to lower nutrient levels.

For instance, the division is in the process of including Regulation 85 phosphorus limits to many domestic sewage systems over 2 million gallons a day.

### Sewage land application sites

Reclaimed water is former wastewater (sewage) that is treated and reused in lieu of discharge to surface water or groundwater. The largest reclaimed water use in Colorado is landscaped irrigation. Biosolids are the sludge waste byproduct of the sewage treatment process. Biosolids can be beneficially reused as a fertilizer and to improve soil conditions.

#### Construction

Construction activities can have a significant impact on water quality if adequate controls are not in place while activities occur. As stormwater flows over a construction site, it can pick up pollutants like sediment, debris, and chemicals and transport them to a nearby storm sewer system or directly to a river or lake. Ground-disturbing activities such as clearing and grading create a situation where pollutant sources come into contact with water and are carried off site into rivers and lakes.

Pumping groundwater to install building foundations, bridge abutments, and other infrastructure provides a direct conduit for large volumes of sediment to be conveyed to nearby rivers and lakes. In urban areas, these dewatering activities often mobilize legacy toxic pollutants that are present in the groundwater due to human practices such as uncontrolled landfilling, leaky underground gasoline tanks, and/or historic manufacturing activities that deposited industrial wastes directly onto the ground, from where it leached into the subsurface water table.

Polluted stormwater runoff and polluted groundwater extracted during construction can harm or kill fish and other aquatic life. Sedimentation can destroy aquatic habitat, and high volumes of runoff can cause stream bank erosion. Trash and other debris can clog waterways and interfere with use of water resources. Once a waterway is impacted by construction discharges, restoration can be a difficult and expensive undertaking.

#### Urban stormwater

Urban stormwater is a significant source of pollution in Colorado. Roads, parking lots, and sidewalks are constructed during land development. Rain and snowmelt generate runoff, which carries pollutants deposited on these impervious surfaces to storm drains. There are many pollutant sources in the urban environment. Some building materials, such as galvanized gutters, are sources of zinc. Asphalt is a source of hydrocarbons. Lawn fertilization is a source of phosphorus and nitrogen, and pesticide application is a source of toxics. Vehicle maintenance is a source of detergents, oils, and greases. Roads and highways are sources of cadmium and lead from brake pad wear, and road de-icing is a source of salts. And urban stormwater runoff can contain high levels

of pathogens, including e. Coli. Pollutant impacts to urban rivers and lakes affect aquatic life and the public's ability to use these water resources for water supply and recreation.

To better control this pollution, local governments including cities, counties, and special districts in urbanized areas and areas of high growth are required to obtain permits for discharges from their Municipal Separate Storm Sewer Systems (MS4s). The permits require entities to develop and implement stormwater management programs to minimize pollutant sources and remove pollutants from the runoff before it enters rivers and lakes. Ongoing efforts are underway in Colorado and many states to reduce the level of pollutant discharges from MS4s to prevent waterbodies from exceeding the applicable water quality standards.

## Commerce and industry

Industrial and commercial facilities may utilize or generate wastewater that needs to be treated or controlled, including any areas where industrial activities occur that are exposed to rain and snowmelt. Pollutants of concern at industrial sites vary by facility, but often include metals that pose risks for aquatic life.

#### Permit actions

Permits establish pollutant levels that can be discharged to surface water and groundwater in a manner that is protective of public health and the environment. Permits also establish details about discharge monitoring and recordkeeping and include instructions on when notification to the state is required, such as in times of poor treatment plant performance.

Permits include robust public notice and public involvement processes: draft general permits, draft individual permits, and draft non-minor modifications are put up for public comment for at least 30 days. All comments within the scope of the action are considered and responded to at permit issuance. There are also opportunities for public meetings and administrative adjudications. In addition, the Division routinely conducts stakeholder meetings prior to developing the draft permit for large general permits (like dewatering and industrial stormwater) and individual permits with significant public interest (like Suncor).

Issuing permits for sewage systems requires a process for reviewing and approving the location and design of treatment facilities and pumping stations. This review work for sewage systems provides a mechanism for ensuring that proposed facilities will be located, designed, operated, and maintained to meet permit requirements and prevent spills and other events that would impact public health and/or the environment. The site location review process also ensures that the provision of proposed wastewater collection and treatment services is consistent with local water quality management planning.

A core statutory requirement is that all permits are subject to routine review because the requirements and conditions under which the discharge was authorized are subject to change. This makes renewal permit actions the most significant workload demand. The division also administers a large number of new discharge authorizations, permit modifications, and permit terminations.

# Permitting pesticide discharges to surface waters

The division's program for permitting pesticide discharges to surface waters was initiated in 2011 when the U.S. 6<sup>th</sup> Circuit Court determined that the application of pesticides to surface waters of the United States constitutes a point source discharge and therefore requires a permit under the Clean Water Act. Discharges from pesticide activities covered under the permit include mosquito and other flying insect control, weed and algae control, forest canopy control and animal pest control. The Pesticide General Permit does not require an application for

coverage but instead provides automatic coverage upon meeting the eligibility requirements in the permit. The permit includes practice based effluent limits and recordkeeping/reporting requirements. Based on division/stakeholder agreement, only the subset of dischargers that apply pesticide products in quantities sufficient to exceed permit threshold limits, or who are otherwise considered to be "automatically in," (special districts, land stewards), are required to submit an annual report and pay an annual fee. The current fee is \$281 per year.

Though the impetus of the 6<sup>th</sup> Circuit case was to determine whether the application of pesticides to water should be considered a point source and require a permit, the outcome of the resulting permit issuance is serving to shed light on the overall presence of pesticides in both Colorado's, and the nation's waters. This is a significant step forward in the effort to inform the public about the character of surface waters across the country.

To provide perspective on the relative presence of pesticides in the nation's waters, the following information was taken from USGS fact sheet, Pesticides in Surface Waters:<sup>6</sup>

- Low levels of pesticides have been widespread in the nation's surface waters for several decades
- Pesticide concentrations in surface waters follow strong seasonal patterns that result from the timing of pesticide applications and runoff conditions
- Many pesticides are rarely detected in surface waters because of relatively low use, how they are applied, chemical properties, or elevated detection limits
- In many streams, some pesticides exceed water quality criteria for seasonal periods each year, but annual average concentrations seldom exceed regulatory standards for drinking water
- Potential effects of pesticides on humans and aquatic ecosystems are difficult to evaluate because of inadequate information on effects of low level mixtures, transformation products, and seasonal exposure
- Improved information is needed on long-term trends, pesticides and transformation products that have not been widely measured, and biological effects of typical exposure patterns
- A number of studies have shown that procedures commonly used at most drinking water treatment plants have little effect on concentrations of herbicides in water

In 2013, the state began allocating \$84,000 a year for the Colorado Department of Agriculture (CDA) to analyze surface water pesticide samples. The money is earmarked for analysis of samples only and does not provide funding for sample collection, which is conducted independently by the division. As of December 2020, twenty-six synoptic sampling events have taken place at a rate of two or three sampling events each year. These sampling events have taken place primarily on the main stems of Colorado's major watersheds, including the Colorado, South Platte, Arkansas, Yampa, White and Rio Grande rivers. Approximately 485 samples have been analyzed since 2013, and each sample is analyzed for 102 different active ingredients, including a small number of transformation products.

Table 13 summarizes results from sampling events that have taken place in Colorado between 2013 and 2020. In the interest of brevity, individual pesticide detections are not identified; rather, a sum total representing all parameters is shown for each sampling event. The total represents the number of detections above the level of quantitation (LOQ) reported by CDA. Individual detections for all sampling events can be found on the sampling summary document on the division's pesticides webpage.

The sampling procedure has been synoptic in nature with samples collected from the targeted stream over a period of one to three days. This procedure provides a "snapshot" of conditions, which can reflect changes that

\_

<sup>&</sup>lt;sup>6</sup> USGS fact sheet, Pesticides in Surface Waters (FS-039-97).

occur along a given set of sites over a short period of time. Sampling events, as currently designed, attempt to characterize Colorado surface waters across their entire length within the state. This generally means that, where possible, samples are taken between the headwaters of a stream and the state border. The South Platte River and the Arkansas River are exceptions to this in that the South Platte was sampled from Ft. Lupton to the eastern Colorado border, and the Arkansas River was sampled from Pueblo to the eastern Colorado border. In addition, the Colorado River sampling event included monitoring of the Gore Creek and Eagle River tributaries.

To date, monitoring conducted through this process has resulted in 1,036 detections of active ingredients used in pesticides. These occurrences have included the detection of approximately 40 different active ingredients. The highest reported value of an active ingredient during these sampling events has been 1.41 parts per billion of the chemical 2,4-D (WQS= 70, water supply); followed by Clothianidin, a neonicotinoid, at 1.01 parts per billion (No existing standard).

Of the active ingredients detected, nine were for parameters with state water quality standards, and 29 were for parameters without state water quality standards. This equates to having no standards for approximately 75% of detected active ingredients. For those active ingredients with standards, none of the analyzed results exceeded a water quality standard.

Colorado incorporates multiple pesticides into its water quality standards, but they are often for active ingredients that are no longer in use or that have previously been banned in the US or elsewhere. The lack of water quality standards for many pesticide active ingredients exists on the national level as well. For example, the EPA has established water-quality criteria for the protection of aquatic organisms for only 20 of the 118 compounds targeted in the studies reviewed in the USGS fact sheet Pesticides in Surface Waters. The fact sheet also identified that aquatic life criteria have not been established for any of the high use agricultural fungicides.

Table 13. Sampling events under program for permitting pesticide discharges between 2013 and 2020

-			•
Sample Date	River Sampled	Total Number of Detects/Sampling Event	Notes/Notable Active Ingredients
Jun-13	South Platte River	43	
Oct-13	Arkansas River	24	Prometon detected - restricted use pesticide
May-14	Rio Grande River	0	
Sep-14	North Fork Gunnison River	41	Tebuthiuron detected - restricted use pesticide
Apr-15	I-70 Corridor	10	Includes Gore Creek and Eagle River. Carbofuran detected.
May-15	Yampa River	0	Spring 2015 was very wet. Applicators indicated many applications had been cancelled due to weather. Heavy spring runoff was also present.
May-15	White River	0	Spring 2015 was very wet. Applicators indicated many applications had been cancelled due to weather. Heavy spring runoff was also present.
Aug-15	Arkansas River	68	Atrazine + degradate (Prometon) detected along entire sampling length.
Sep-15	South Platte River	234	Prometon (RUP), Tebuthiuron (RUP), Atrazine
Jul-16	Yampa River	7	2,4-D only (0.51 ug/l = max value)
Jul-16	White river	3	Malathion only (0.34 ug/l = max value)
Sep-16	Rio Grande River	1	2,4-D
Oct-16	I-70 Corridor	9	Atrazine detected
Apr-17	Denver Corridor	19	South of Chatfield Reservoir to Clear Creek. 8 active ingredients; Atrazine, Tebuthiuron (RUP)

Sample Date	River Sampled	Total Number of Detects/Sampling Event	Notes/Notable Active Ingredients
Jun-17	Arkansas River	37	8 active ingredients; AMPA, Atrazine, Dicamba
Jul-17	North Fork Gunnison River	41	14 active ingredients; Dicamba, Imidacloprid (a neo-nicotinoid)
Oct-17	South Platte River	131	15 active ingredients; Imidacloprid, Clothianidin (1.01 ug/l)
May-18	North Fork Gunnison River	16	8 active ingredients; 2,4-D, DEA, Clothianadin
Jul-18	I-70 Corridor	15	7 active ingredients; Aldicarb-sulfoxide, Dinotefuran, 2,4-D
Sep-18	Yampa River	1	Dicamba
Sep-18	White River	0	
Jul-19	Rio Grande River	3	2,4-D
Jul-19	South Platte River	100	17 active ingredients; Atrazine + DEA, AMPA, Tebuthiruon
Jul-19	Denver Corridor	55	12 active ingredients; Tebuthiuron, Imidicloprid, Atrazine
May-20	Clear Creek	46	10 active ingredients; Heavy AMPS, 2,4-D, Tebuthiuron
June-20	Cherry Creek	35	9 active ingredients
Sept-20	Denver Corridor	68	12 active ingredients; Tebuthiuron
Sept-20	Poudre River	29	8 active ingredients
Total		1,036	

Due to the episodic and seasonal variability associated with pesticide applications to surface water, data only provides limited point-in-time pictures of pesticide occurrences in Colorado surface waters. The data should not be interpreted as providing quantitative information on the expected frequency or concentration of pesticide active ingredients in surface waters, but only that the active ingredients identified have a potential for being present above detection limits. The data does not provide evidence for the absence of active ingredients in Colorado surface waters.

Nationwide, annual mean concentrations of pesticides rarely exceed water quality standards or drinking water maximum contaminant levels (MCLs). However, stream concentrations are known to exceed the standards in specific samples and at certain times of the year. The USGS fact sheet Pesticides in Surface Waters identifies multiple examples where stream concentrations and/or monthly averages exceed water quality standards but annual average concentrations remain below the standards. Because drinking water treatment plants may have little effect on what are generally low concentrations of pesticides in surface water, drinking water derived from some surface water sources can contain concentrations of one or more compounds above the MCLs for part of the year even though monitoring results may not identify those exceedances.

The ability to assess the significance of pesticides in surface waters is limited by several factors. First, water quality criteria have not been established for most pesticides and pesticide transformation products, and existing criteria should be revised as more is learned about the toxicity of these compounds. Second, criteria are based on tests with individual pesticides and do not account for possible cumulative effects when several different pesticides are present, as is often the case. Compounding the data gap are pesticide additives, which are designed to provide improved product performance. They are widely used, generally unregulated and often proprietary. Finally, many pesticides and most transformation products have not been widely monitored in surface waters. These factors, and the lack of data on long-term trends, show significant gaps in our

understanding of the extent and significance of pesticide contamination in surface waters. Analysis of scientific literature indicates a need for long-term monitoring studies in which a consistent study design is used to target heavy-use and trending pesticides along with their transformation products.

# Nonpoint source program

The nonpoint source program continued to focus resources on addressing priority nonpoint sources of pollution during the reporting period of July 2019 through June 2021. Unlike pollution from industrial and sewage treatment plants and other regulated discharges, nonpoint source pollution comes from many sources spread out over large areas and is caused by runoff resulting from rainfall or snowmelt. As the runoff moves over and through the ground, it picks up, carries away, and deposits natural and human made pollutants in lakes, rivers, wetlands, and groundwater. Common categories of nonpoint source pollution in Colorado include abandoned mine lands, agriculture, forestry, hydromodification/habitat alteration, and urbanization.

### Success Story Initiative

The Success Story Initiative is one of the nonpoint source program's primary ways of measuring the effectiveness of its work. Success stories document nonpoint source activities that result in the reduction of nonpoint source pollution and the attainment of water quality standards. In collaboration with many partners, the nonpoint source program reported two success stories from 2019-2021. Summaries of these success stories are provided below. Additional information can be found at <a href="https://www.epa.gov/nps/success-stories-about-restoring-water-bodies-impaired-nonpoint-source-pollution">www.epa.gov/nps/success-stories-about-restoring-water-bodies-impaired-nonpoint-source-pollution</a>

### Restoration of Straight Creek along I-70 at the Continental Divide

Hillslope erosion and traction sanding on Interstate 70 (I-70) west of Denver contributed sediment-laden runoff to Straight Creek. In 1998, the commission determined that Straight Creek was water quality impaired by sediment and placed it on the Clean Water Act (CWA) Section 303(d) list of impaired waters. This was one of the earliest 303(d) lists for the state and the subject of the first sediment total maximum daily load (TMDL) report in 2000. In cooperation with many partners, numerous innovative best management practices (BMPs) were implemented that successfully reduced sediment runoff in this high alpine watershed. Monitoring data confirmed improved water quality and attainment of the sediment water quality standard for aquatic life use. Straight Creek was identified as Category 1-Attaining in the Colorado 2018 Integrated Report. This segment is now included in the new IR Category 1b.

#### Restoration of Horse and West Creeks through Best Management Practices Implementation

The Hayman Fire in 2002 was Colorado's first recorded wildfire exceeding 100,000 acres. Following the Hayman Fire, Horse Creek and West Creek in the Upper South Platte basin, a major source of drinking water for Colorado's Front Range, were significantly impacted by nonpoint source pollutants such as sediment and debris from storm runoff. A water quality assessment showed that these creeks failed to support aquatic life use for macroinvertebrates. The commission added Horse Creek and its tributaries, as well as West Creek, to the Clean Water Act (CWA) Section 303(d) list of impaired waters in 2012 and 2016 respectively. Numerous innovative best management practices (BMPs) were implemented in collaboration with many partners through the Hayman Restoration Project. After BMP installation, monitoring data confirmed that water quality was successfully restored in these watersheds. In 2020, these waterbodies were removed from the 303(d) listing for Aquatic Life and re-categorized as Category 1-Attaining in Colorado's Integrated Report. This segment is now included in the new IR Category 1b.

## Nutrient nonpoint source reductions - Regulation 85

In addition to demonstrating success through nonpoint source pollution reduction and attainment of water quality standards, the nonpoint source program worked with the agricultural community during this reporting period to share information about and document the effectiveness of nutrient BMPs. This collaboration was associated with Regulation 85 and its discussion of voluntary nutrient controls, information and education campaigns about nutrients, and monitoring nutrients to better understand sources and effectiveness of nutrient controls. The nonpoint source program proactively partnered with Colorado State University, the South Platte Agriculture Nutrients Committee, a number of agricultural producers, and many others to continue progress to voluntarily reduce nonpoint sources of nutrients through BMP implementation.

The results of the progress made to-date to reduce nonpoint sources of nutrients were presented to the commission in October 2020. The division provided information for three metrics (commitment of resources; participation by nonpoint source partners and producers; and reduction of nonpoint sources of nutrients) that demonstrated sufficient progress was being made in managing nonpoint sources of nutrients under Regulation 85.

## Nonpoint source funding and technical assistance

The nonpoint source program maximizes its partnerships, resources, and opportunities to show success through its funding and technical assistance activities. These activities are focused on working with partners to address priority nonpoint sources of pollution that are defined in the program's management plan. During 2019-2021 the program continued to implement the 2012 management plan with particular emphasis on the priorities of reducing nonpoint sources of selenium, nutrients, and E. coli. Projects addressing these pollutants were funded through both Clean Water Act Section 319 grants from the EPA (with matching state Water Quality Improvement Funds when available) as well as state revolving fund administration fees overseen by the Colorado Water Resources and Power Development Authority (CWRPDA).

Of the \$4,939,002 in project funding administered during the reporting period to initiate new and expand on existing projects, over three-quarters was received through Section 319 grants and associated Water Quality Improvement Funds, with the rest of the funding provided by CWRPDA. Table 14 focuses on the projects that were funded between July 2019-June 2021 which represents a subset of all projects managed by the nonpoint source program during this reporting period.

Table 14. Nonpoint source projects funded in 2019-2021

Project Title	Project Sponsors	319 Funding (includes WQIF)	CWRPDA Funding	General Project Type	Project Category
Lower Arkansas Valley Best Management Project Implementation	Lower Arkansas Valley Water Conservancy Dist.	\$796,493		BMP implementation	Agriculture
Lower Aspen Canal Pipeline and Interconnect	Crawford Water Conservancy District	\$479,839		BMP implementation	Agriculture
Lower Arkansas Best Management Practices Implementation Phase III	Lower Arkansas Valley Water Conservancy Dist.	\$698,913		BMP implementation	Agriculture

Project Title	Project Sponsors	319 Funding (includes WQIF)	CWRPDA Funding	General Project Type	Project Category
Water Quality, Soil Health and Regenerative Agriculture: A Nexus for Sustainability	Colorado State University	\$428,214		BMP implementation	Agriculture
Forestry BMP Implementation, Statewide BMP Monitoring and Manual/Forest Roads Field Handbook Revision	Colorado State University	\$292,010		BMP implementation	Forestry
Implementation of a Replicable Community- and Youth-Driven Urban Pollution Reduction Plan for a HUC12 in Denver and Adams Counties	Lincoln Hills Cares	\$79,197		BMP implementation	Urbanization
Idlewild Canyon Post-Wildfire Implementation Project	Arkansas River Watershed Collaborative	\$300,000		BMP implementation	Forestry
Lower Beaver Creek - Brush Wetland Demonstration Project	Ducks Unlimited	\$123,716		BMP implementation	Agriculture
Slate River Integrated Monitoring and Planning	Coal Creek Watershed Coalition	\$20,440		Watershed planning	Forestry
Upper Gunnison River Water Quality Characterization and Preliminary Planning	Upper Gunnison River Water Conservancy District	\$24,000		Watershed planning	Agriculture/ urbanization/ abandoned mine lands
Addressing NPS Pollution through Regional Planning	CDR and Brown and Caldwell	\$49,880		Water quality planning best practices	Program support
NPS Watershed Plan and Tool Development	Various Local Sponsors	\$320,859	\$240,000	Watershed characterization & planning	Information & education/ program support
NPS Success Story Initiative	State Laboratory	\$30,000		BMP evaluation	Program support
Shavano and Mancos Conservation Districts Water Quality Education and Outreach	Mancos Conservation District	\$56,000		Outreach & education	Information & education
Wildfire Coordination	Coalitions and Collaboratives	\$1,514		Outreach & education	Information & education
NPS Mini Grant Program	Various Local Sponsors	\$70,000		Outreach & education	Information & education
NPS Outreach & Education	Colorado Watershed Assembly	\$55,222		Outreach & education	Information & education

Project Title	Project Sponsors	319 Funding (includes WQIF)	CWRPDA Funding	General Project Type	Project Category
Spring Creek Fire Response	Huerfano County Water Conservancy District		\$185,916	BMP implementation	Forestry
Decker Fire Recovery	Chaffee County		\$149,950	BMP implementation	Forestry
Cameron Peak Fire Recovery	Coalition for the Poudre River Watershed		\$163,077	BMP implementation	Forestry
East Troublesome Fire: Post-Fire Flooding and Erosion Treatments	Colorado State University		\$99,569	BMP implementation	Forestry
North Empire Creek BMP Improvements	Trout Unlimited		\$24,983	BMP operation & maintenance	Abandoned mine lands
NPS and TMDL Modeling Support	Colorado State University		\$75,000	Watershed characterization/BMP implementation	Agriculture
Nonpoint source BMPs calendar and postcards	Moxiecran Media		\$25,000	Outreach & education	Information & education
Water Quality Public Perceptions Survey Followup	Corona Insights		\$149,210	Outreach & education	Information & education

The distribution of funds received across different nonpoint source project categories is shown in Figure 9. The figure highlights the program's 2019-2021 priority of addressing agricultural nonpoint sources of selenium and nutrients, with 53% of the nonpoint source funding spent in this category.

Additional information about the nonpoint source program and its work with partners across the state, including highlights about project results and partnership accomplishments, is available at www.npscolorado.com.

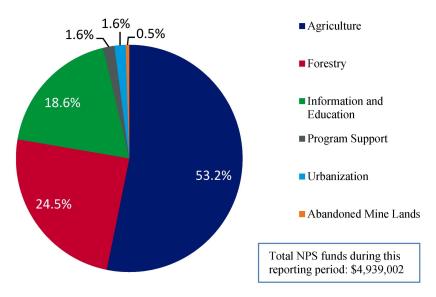

Figure 9. Nonpoint source project funding per category.

# Measurable Results Program

The Measurable Results Program studies to evaluate the effectiveness of construction and renovation activities for wastewater treatment facilities and stormwater systems as well as characterizing nonpoint source reduction projects. The primary focus of the Measurable Results Program for nonpoint source projects has been in legacy mining impacted areas. Staff and laboratory analysis funding are provided through the Colorado Water Resource and Power Development Authority.

The Measurable Results Program systematically measures the chemical, physical and microbiological water quality changes derived from point source pollution control activities funded through the Water Pollution Control Revolving Loan Fund. A summary of these studies can be found further in this document in the Water Pollution Control Revolving Fund Measurable Results Initiative section (page 56).

Colorado has an estimated 23,000 abandoned mines. Additionally, approximately 1,800 miles of streams are impaired by heavy metals or low pH. Historically, legacy mines or abandoned mine lands have lacked a financially viable responsible party, making restoration efforts difficult. Due to these significant challenges of restoring water quality for abandoned mine lands, the division focused resources to characterize water quality impacts of abandoned mines to support clean-up decisions, support restoration planning, and measure the water quality improvements from completed restoration projects.

The program capitalizes on multi-disciplinary teams and agencies. The Division of Reclamation, Mining and Safety is involved in project selection, site characterization planning, and water quality monitoring and data assessment. Additionally, collaboration routinely occurs with the U.S. Forest Service, EPA, Bureau of Land Management, U.S. Fish and Wildlife Service, Trout Unlimited, local watershed groups, and municipalities.

## East Mancos Abandoned Mine Water Quality Synoptic Study

The division sponsored a comprehensive synoptic study of mine-impacted streams in the East Mancos watershed in Montezuma County. This cooperative effort with the Division of Mining, Reclamation and Safety assessed approximately 70 locations associated with mine complexes in the watershed. Data were collected during sample events between September 2018 and July 2020. Mine features that contribute to the impairment of nearby waterbodies will be prioritized for mitigation and restoration efforts. A data summary and analysis report is expected to be finalized in 2021.

## Evans Gulch Abandoned Mine Post-Mitigation Synoptic Study

The division supported a synoptic water quality study in the Evans Gulch watershed near Leadville in Lake County to determine the net change in water quality due to abandoned mine area mitigation by Trout Unlimited and the nonpoint source program in 2019. This watershed serves as the primary municipal water supply for approximately 5,000 residents of Lake County and Leadville. In 2019, mitigation work was completed at the Silver Spoon and Valley mines. This included removal of streamside tailings, rough grading, erosion control, clean water management, limestone, fertilizer, compost, and clean fill cap material that was seeded and mulched. Load reductions for pollutants of concern are predicted to be approximately 20% which translates to an annual potential reduction of 756 pounds of zinc, 47 pounds of nitrogen, and 280 tons of sediment. With the analytical and technical assistance of the division, stakeholders sampled approximately 12 locations to determine the efficacy of post-mitigation water quality conditions in the watershed. This high-flow sampling event occurred in June of 2021.

### Mine Impacted Streams Task Force

The Mine Impacted Streams Task Force was formed in September 2015 to determine the extent and magnitude of water quality impacts due to abandoned mines and to drive water quality improvements from abandoned mine pollution control projects. The task force includes the division, Division of Reclamation, Mining and Safety, and the Colorado Department of Public Health and Environment's Hazardous Materials and Waste Management Division. More information is available at <a href="https://www.colorado.gov/cdphe/WQ-Mine-Impacted-Streams-Task-Force">www.colorado.gov/cdphe/WQ-Mine-Impacted-Streams-Task-Force</a>. The task force collaborated on the following two key initiatives:

#### Abandoned Mines Lands Information Hub

The division contracted with the Colorado Geological Survey (survey) to develop a cloud-based map application with more than 50,000 abandoned mine records, which was deployed in 2017. The application includes a public map viewer as well as an internal agency user login version to support decision making. The survey coordinated disparate data sets from more than a dozen state and federal agencies. State and federal agencies are currently developing collaborative tools through the cloud-based application to support restoration planning and decision making efforts.

Abandoned Mines Lands Information Hub: https://erams.com/aml

### **Abandoned Mines Water Quality Study**

This study was a collaborative effort between the division and the Division of Reclamation, Mining and Safety. In the fall of 2016, 165 abandoned mines were visited, and 145 of those were surveyed and sampled. The sample results, survey forms, and photographs are publically available below:

 Colorado Abandoned Mine Land Water Quality Information: <u>erams.com/co-abandoned-mines-water-quality</u>

In 2019, state, federal, and non-governmental organizations continued to use this study as a foundation for prioritizing additional environmental impact characterizations and reclamation efforts. In the summer of 2019, the EPA led multi-agency teams to collect information regarding environmental impact and reclamation feasibility of roughly 29 abandoned mine sites. This important prioritization will help inform future efforts by all agencies to mitigate impacts of legacy mine sites on water quality in Colorado.

## Cost/benefit assessment

The benefits of clean water and a healthy environment are challenging to quantify monetarily. The people of Colorado rely on qualitative benefits, as they expect a safe environment in which they can live and thrive. The Clean Water Act ensures availability of clean, safe drinking water, adequately maintained wastewater treatment facilities, biological diversity, and an aesthetically pleasing natural environment for recreation. The mechanisms for providing such a clean and safe environment are divided among the federal, state, and municipal governments. Therefore, it is difficult to obtain a full accounting of the total cost of water pollution control efforts throughout the state. However, it is possible to quantify federal and state investments for water quality by calculating the funding received under the Clean Water Act and other state programs such as the energy impact program. The funding received through the EPA Clean Water State Revolving Fund program for water pollution control activities over the last two years is shown below, excluding state match. These amounts exclude all drinking water expenditures. All amounts have been rounded to the nearest hundred thousand.

2020: \$12.7 million2021: \$12.7 million

# Water Pollution Control Revolving Fund financial assistance

The State Revolving Fund Loan Program is a funding mechanism managed by the division's grants and loans unit. From July 1, 2019 through June 30, 2021, the division assisted with the planning and financing of 25 water quality improvement projects as outlined in Table 15. These projects have improved water quality by reducing pollutant loadings through wastewater treatment facility and stormwater infrastructure upgrades, replacement of aging infrastructure, and consolidation with larger wastewater treatment systems. Funding was provided from the Water Pollution Control Revolving Loan Fund. The total amount of funding, in the form of principal forgiveness, zero percent interest, or low interest loans, was \$110.4 million. Projects funded solely with state grant monies have not been included in the table.

Table 15. Colorado Water Pollution Control Revolving Loan Fund

Assistance Recipient	WPCRF Loan Amount	Loan Date	Project Description
Mountain View, Town of	\$810,000	7/2/19	The project consists of rehabilitation to the existing sewer collection system, and includes reconstruction and installation of a new stormwater drainage system.
Dinosaur, Town of	\$105,000	9/26/19	The project consists of lining lagoon cell #1 to restore the evaporative lagoon system, installing a mixer, and associated appurtenances.
Dinosaur, Town of	\$100,000	9/30/19	The project consists of lining lagoon cell #1 to restore the evaporative lagoon system, installing a mixer, and associated appurtenances.
Olney Springs, Town of	\$342,116	2/25/20	The project includes replacement of sewer collection system, manholes, and associated appurtenances.
Superior Metropolitan District No. 1	\$6,819,320	5/28/20	This project replaces the existing headworks with a new headworks facility, installation of odor control systems, rehabilitation and improvement of the existing equalization ponds and a new interceptor sewer.
Westminster, City of	\$23,331,532	5/28/20	The project consists of CIPP lining and replacement of several areas of the Big Dry Creek sewer interceptor, and installing a parallel gravity sewer interceptor along portions of Big Dry Creek.

Assistance Recipient	WPCRF Loan Amount	Loan Date	Project Description
Security Sanitation District	\$14,610,008	5/28/20	The project consists of system upgrades and site improvements including, but not limited to, flood protection; headworks facilities upgrades including new mechanical screen, screening compactor and washer, new grit removal system; Integrated Fixed Film Activated Sludge system; secondary clarifiers; sludge handling system; ultraviolet radiation disinfection system improvements; new dewatering process; and associated appurtenances.
Idaho Springs, City of	\$3,000,000	6/30/20	The project consists of a wastewater treatment plant expansion to include a new secondary treatment process of granular activated sludge.
La Veta, Town of	\$1,900,000	8/31/20	The project includes a new mechanical wastewater treatment facility, pre-treatment, influent flow monitoring, batch reactors, flow equalization tanks, UV disinfection, effluent flow monitoring, emergency generator, SCADA, and associated appurtenances.
Las Animas, City of	\$300,000	9/28/20	The project consists of improvements to the WWTF wetland cell and replacing portions of the sewer collection system.
Bethune, Town of	\$146,902	10/6/20	The project consists of the construction of a complete retention/evaporation pond system.
Evans, City of	\$8,392,372	11/18/20	The project consists of two major stormwater construction projects designed to mitigate severe localized flooding and exercise best management practices that reduce the discharge of pollutants from the system. The work includes new storm sewer conveyance infrastructures and outfall structures; and replacement, upsizing, and various appurtenances of the stormwater control system.
Sterling, City of	\$33,466,640	11/18/20	The project includes expansion and improvements of the existing wastewater treatment facility including improvements and upgrades to the headworks facilities, influent pump station and force main, equalization basin, biological treatment processes, secondary clarifiers, process pumping systems, disinfection system, and process control facilities.
Manitou Springs, City of	\$554,400	12/23/20	The project consists of the removal and replacement of sanitary sewer collection pipe; the existing clay pipe systems will be replaced with new PVC systems; reconnection of services is included.
Hugo, Town of	\$1,500,000	12/28/20	The project consists of the decommissioning and demolition of the existing wastewater system components and construction of an evaporative pond wastewater treatment system, a lift station and associated appurtenances.
St. Mary's Glacier Water and Sanitation District	\$300,000	1/28/21	The project consists of new wastewater treatment plant headworks, SCADA, aeration system, blowers, clarifier, a building addition for backup power and chemical feed equipment, and additional appurtenances. Additionally, the project will include replacement and repair of collection system piping and additional appurtenances.
West Jefferson County Metropolitan District	\$3,000,000	1/29/21	This project consists of replacing and upgrading the existing activated sludge basin, which is at the end of its useful life cycle, with a new process capable of meeting forthcoming nitrogen and phosphorous regulations. The project also includes new blowers, chemical storage and a new operations building that will house a laboratory, motor control center, SCADA, office, storage and common work areas.
Peetz, Town of	\$400,000	2/3/21	The project consists of decommissioning the existing lagoons, construction of a new evaporative lagoon WWTF and associated appurtenances.
Las Animas, City of	\$1,535,617	2/26/21	The project consists of improvements to the WWTF wetland cell and replacing portions of the sewer collection system.

Assistance Recipient	WPCRF Loan Amount	Loan Date	Project Description
Alma, Town of	\$238,852	3/15/21	The project consists of the complete decommissioning of the existing aerated lagoon system and the construction of a new treatment facility. The proposed system includes a mechanical headworks screen, alkalinity feed, lift station, chlorine injection and contact chamber, influent/effluent flow monitoring, treatment building, yard piping, and an emergency generator.
Creede, City of	\$220,772	4/2/21	The project consists of the rehabilitation of the existing collection system and consists of replacing failing ductile iron pipe segments with new PVC pipe. The project will resolve significant inflow/infiltration issues and will also help address high levels of dissolved cadmium and zinc at the city's wastewater treatment facility.
Mount Werner Water and Sanitation District	\$3,000,000	5/11/21	The project consists of replacement and upsizing of interceptor piping and associated appurtenances.
Genoa, Town of	\$10,000	5/14/21	The project consists of replacing the polypropylene liners in three lagoon cells.
Platteville, Town of	\$6,300,000	5/28/21	The project consists of replacing the existing lagoons and constructed wetlands with a new headworks building including screening and grit removal, a new sequencing batch reactor (SBR) treatment system and replacing chlorine disinfection with UV disinfection.
Genoa, Town of	\$50,000	6/14/21	The project consists of replacing the polypropylene liners in three lagoon cells.

Based on the annual survey of local governments across the state, the identified wastewater, stormwater and nonpoint source needs over the next 20 years totals approximately \$10.9 billion (as documented in the 2021 Water Pollution Control Revolving Fund Intended Use Plan). Wastewater discharge permit requirements, aging infrastructure, and population growth are all factors in wastewater infrastructure needs.

## Water Pollution Control Revolving Fund Measurable Results Initiative

The Measurable Results Program systematically measures the chemical, physical and microbiological water quality changes derived from point source pollution control activities funded through the Water Pollution Control Revolving Loan Fund. The fund provides local governments and water and sanitation districts with affordable financing in the form of low or no interest loans for construction and renovation of publicly owned wastewater treatment facilities, stormwater systems, and other pollution control projects. The grants and loans unit administers these funds.

The Measurable Results Program analyzes laboratory and field data to determine the effectiveness of these pollution control projects.

#### **Current Measurable Results studies:**

#### City of Wray

The City of Wray received a Water Pollution Control Revolving Fund loan of \$1.6 million dollars to improve its existing wastewater treatment facility, which discharges to the North Fork of the Republican River (COSPRE03). The City of Wray installed aeration system upgrades to the existing lagoons and constructed biological media reactors and disc filters for advanced treatment of biochemical oxygen demand (BOD) and ammonia. Ultraviolet light disinfection replaced chemical disinfection. Sampling for this study began in October 2016 and was completed in December 2018. The study included monitoring of the Republican River and wastewater effluent of

the existing and new facilities. Project monitoring was a collaborative effort between the City of Wray staff and division staff. A final data summary fact sheet was completed and submitted to the City in May of 2020.

#### City of Durango

The City of Durango received a Water Pollution Control Revolving Fund loan of \$62.2 million dollars to address secondary process capacity issues and to meet future effluent requirements. The City of Durango has undergone a two-phase improvement process for this project. This facility currently discharges to the Animas River (COSJAF05a). This study began in September 2017 and included monitoring of the Animas River and wastewater effluent of the existing and new facilities. Pre-project sampling was completed in February of 2018 and post-project sampling was completed in September of 2020. The City of Durango staff worked closely with the monitoring team and received monitoring data on a regular basis. A collaborative final report developed by the division with City staff and the Mountain Studies Institute is anticipated to be finalized late in 2021.

#### Town of Nucla

The Town of Nucla received an Energy Impact Assistance Fund grant of \$1 million and a Water Pollution Control Revolving Fund loan of \$1.6 million to construct improvements to the existing wastewater treatment facility. The improvements are being implemented so that the facility will meet effluent limits based on stream standards for ammonia during winter months. This facility discharges to Calamity Draw (COGUSM12b). The Town of Nucla received approval for a discharger specific variance (DSV) from the commission in October 2016. Although this study began in July 2017, post-construction conditions are not expected until sometime in 2022. The study includes monitoring of Calamity Draw and wastewater effluent of the existing and new facilities. The Town of Nucla staff is collaborating with the monitoring effort.

#### Three Lakes Water and Sanitation District

The Three Lakes Water and Sanitation District received a Water Pollution Control Revolving Fund loan of \$2.9 million dollars to construct improved treatment technologies. Potentially dissolved copper is being leached from several rural drinking water service areas that the sanitation district does not control but that feed into the Table Mountain treatment facility. The most cost-effective option for the district is to reduce copper in treated effluent. Although potentially dissolved copper is the only parameter currently exceeding limits, decreases in other effluent parameters are expected with the addition of a proprietary sand filtration system. This facility discharges to an unnamed, intermittent tributary (COUCUC06b) but ultimately outfalls to Willow Creek (COUCUC05\_B). Monitoring began in September 2019, construction was completed in December 2020, and post-construction monitoring is expected to be completed in December 2021 with a final report to follow. Monitoring the unnamed tributary, Willow Creek, and the plant effluent will provide robust information for analysis and reporting. Three Lakes Water and Sanitation District staff are collaborating with division staff to help with effluent sampling and operational needs.

#### City of Idaho Springs

The City of Idaho Springs is constructing new treatment technologies to address hydrologic and organic overloading. The design capacity of the plant has exceeded 80%, so the plant is required to implement improvements in two phases. For the first phase, the City of Idaho Springs received a \$10,000 planning grant, a \$300,000 Design & Engineering grant, a \$1,000,000 DOLA grant, and a \$3,000,000 low interest revolving fund loan to construct improved treatment technologies and increase capacity. For the second phase, the City of Idaho Springs received an additional \$300,000 Design & Engineering grant, a second \$1,000,000 DOLA grant and another \$3,000,000 low interest revolving fund loan to construct improved treatment technologies and increase capacity. The Idaho Springs plant currently discharges to Clear Creek (COSPCL11\_A). Monitoring began in October 2019 and

continues in order to capture subtle changes in effluent water quality due all project phases. Construction is anticipated to be complete in the summer of 2022 with post-project sampling to follow. The project monitors the plant effluent, Clear Creek, and a side spring discharging to the sample reach. City of Idaho Springs staff are collaborating closely with division staff on this project.

# Identification of restoration approaches

### Total Maximum Daily Loads and alternative restoration plans

For category 5 waterbodies identified in the Integrated Report, restoration approaches must be developed to improve water quality and ultimately attain water quality standards. Total Maximum Daily Loads (TMDLs) are an important foundation for defining these restoration approaches, as are alternative restoration plans. The development of TMDLs and alternative restoration plans is a focus for the division's Watershed Analysis and Implementation Support (WAIS) workgroup.

A TMDL is the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards. The formula to express a TMDL is:

TMDL = Wasteload Allocation (WLA) for point source discharges + Load Allocation (LA) for nonpoint source discharges + Margin of Safety.

A TMDL sets a pollution budget for a waterbody that takes into account all potential sources of the pollutant. Each source is allocated a portion of the budget. If the amount of a pollutant contributed to the waterbody by a particular source during a period of time is greater than the amount budgeted for that source, a reduction is identified.

An alternative restoration plan is a near-term plan, or description of actions with a schedule and milestones that is more immediately beneficial or practicable for achieving water quality standards than developing a TMDL. An alternative restoration plan may be appropriate when there are unique local circumstances such as the presence of a watershed group or other parties with available funding opportunities to address the cause of impairment in the near-term. An alternative approach plan may also be appropriate if an initial review determines that particular point or nonpoint sources are responsible for the impairment and there are clear mechanisms to address these sources.

## Monitoring in support of developing restoration approaches

Both TMDLs and alternative restoration plans require more water quality data than what was used in the impairment determination. These additional data are collected at more sites and at a higher frequency to estimate source contributions as well as evaluate exceedances that occur throughout the year under many different conditions.

The WAIS workgroup collected selenium, metals, and *E. coli* data for use in TMDLs and alternative restoration plans currently under development in the Arkansas, Lower Colorado, and South Platte river basins.

In addition to this routine data collection to support TMDL and alternative restoration plan development, the WAIS workgroup secured funding from the Colorado Water Resources and Power Development Authority and partnered with Colorado State University to conduct *E. coli* and stream flow monitoring at a frequency and

spatial resolution to support development of *E. coli* TMDLs for the Cache la Poudre River and Sand and Clear Creeks.

### **Approved TMDLs**

During this reporting period, the WAIS workgroup continued to implement its draft 2015 TMDL prioritization strategy that focuses on metals, selenium, and *E. coli*. As the Integrated Report was being developed, the workgroup public noticed a final TMDL report for some Colorado River tributaries in the Grand Valley, Mesa County and anticipates EPA approval for this TMDL report that addresses 11 listed waterbodies and three pollutants causing exceedances of water quality standards (Table 16).

Table 16. TMDLs completed 2019-2021

Final TMDL Reports July 2019-June 2021							
Waterbody AUID Waterbody Pollutants Anticipated Approval Date							
COLCLC13b_A through D	Colorado River tributaries	Se, Fe, E. coli	10/21				

## Implementation support

In addition to developing TMDLs and alternative restoration plans, the WAIS workgroup supports implementation of these analyses and plans through collaboration with the division's permits section and nonpoint source workgroup. Throughout this reporting period, the WAIS workgroup assisted the permits section with incorporating TMDL wasteload allocations into discharge permits and continued its collaboration with the nonpoint source workgroup and numerous partners in the Lower Arkansas River Valley, the Grand Valley and the Fountain Creek watershed to promote nonpoint source pollution reduction. The WAIS and Nonpoint Source workgroups also continued coordination on implementing TMDLs through Clean Water Act Section 208 regional water quality management plans, Clean Water Act Section 319-funded watershed plans, and implementation of reservoir control regulations.

## TMDL and alternative restoration plan development targets

The TMDL and alternative restoration plan development targets for 2022 and 2023 are shown in Table 17. The time horizon for the WAIS workgroup's current development priorities ends in 2022; therefore a complete list of all targets for TMDLs and alternative restoration plans that will be developed in 2023 is not yet available. These post-2022 development targets will be identified through a prioritization exercise that will be conducted in 2022.

Additional information about the TMDL development and alternative restoration plan prioritization strategy and the targets through 2022 is available on the division's website at <a href="https://www.colorado.gov/cdphe/total-maximum-daily-loads-tmdls">www.colorado.gov/cdphe/total-maximum-daily-loads-tmdls</a>. The division and the commission websites also provide more information about TMDL processes and annual activities as well as links to approved TMDL reports.

Table 17. TMDL and alternative restoration plan development schedule for 2022 and 2023

# Source water assessment and protection effort summary

Source water assessment and protection (SWAP) is designed to provide the public consumer with information about their untreated drinking water and provide the community with a way to get involved in protecting the quality of their drinking water. The program encourages community-based protection and preventive management strategies to ensure that all public drinking water resources are kept safe from future contamination.

The division completed the initial source water assessment reports for over 1,700 public water systems in November 2004. The results of the assessment reports can be reviewed at:

www.colorado.gov/cdphe/swap-assessment-phase

The division's source water assessment and protection efforts have continued to focus primarily on the protection planning phase. The long term project goal is voluntary development and implementation of local source water protection statewide. The ongoing success of the program requires a coordinated effort between the division and local interests such as public water systems, interested stakeholders, and local governments.

The role of the division is to assist local protection planning efforts by supplying the lead protection entity with the necessary technical and financial resources to complete a protection plan. The division supports protection planning efforts in coordination with Colorado Rural Water Association, which typically facilitates the locally driven planning processes. Funding for protection planning is available from the State Drinking Water Revolving Fund set-asides and has recently been funded by Colorado Water Resource and Power Development Authority funding (Clean Water administration fees). Set-aside monies from the State Drinking Water Revolving Fund Loan Program enable the source water assessment and protection program to provide financial support for protection plan development. The set-asides allow the state to utilize a percentage of its capitalization grant to assist in the development of local drinking water protection initiatives and other state projects. The grant funds are awarded for protection plan development and implementation projects.

Development and implementation grants are awarded to public water systems and representative stakeholders committed to developing a source water protection plan. Grants up to \$5,000 are awarded for plan development and implementation. A one-to-one financial match (cash or in-kind) is required.

Grant proposals are submitted electronically and reviewed by the division. Projects recommended for funding receive an award notification and a grant for the protection planning effort. All grant funds are distributed on a reimbursement basis and invoicing can occur as an equal match for the grant. Proposals are accepted throughout the year. Grant awards are subject to the availability of set-aside funds. For more details on grant requirements, guidance and access to the electronic grant application, please visit:

www.colorado.gov/cdphe/swap-protection-phase

The following table (Table 18) describes the current status of protection planning efforts statewide.

Table 18. Statewide source water protection planning status

Statewide Source Water Protection Planning Status				
State Fiscal Year	Annual Funding Encumbered	Number of Substantially Implemented Protection Plans	Population with Protection Plans	
2009	\$77,220	17	59,877	
2010	\$155,390	34	486,154	
2011	\$149,240	44	548,824	
2012	\$140,000	79	561,622	
2013	\$95,000	117	669,575	
2014	\$146,200	136	721,198	
2015	\$116,428	153	2,067,586

2017	\$82,500	203	2,495,582	
2018	\$30,000	222	2,580,235	
2019	\$65,000	229	2,727,746	
2020	\$40,000	237	2,862,528	

# Clean Water Act Section 401 Water Quality Certifications

Clean Water Act Section 401 Water Quality Certification is a state certification of a federal license or permit to construct or operate facilities which may result in any discharge to waters of the United States. A 401 Water Quality Certification is required from the division for Section 404 individual permits issued by the U.S. Army Corps of Engineers, Federal Energy Regulatory Commission licenses for hydropower projects, and other federal permits which involve a discharge into waters of the state, including federal Clean Water Act Section 402 permits issued by the EPA. The 401 Water Quality Certification applies to water quality impacts during both the construction and operation of the project for which the federal license or permit is required. In 2015, Colorado House Bill 15-1249 was signed and created a fee system for 401 water quality certifications. The house bill created four 401 water quality certification tiers:

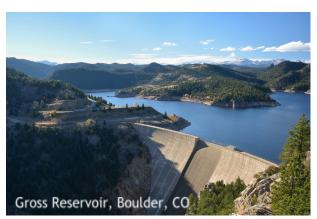

- Tier 1 Projects that incur minimal costs and minimal water quality impacts
- Tier 2 Projects that incur moderate costs and potential water quality impacts
- Tier 3 Projects that include certifications of FERC relicensing projects or projects involving more long-term water quality impacts
- Tier 4 Projects that involve multiple or large watershed areas, a very high degree of complexity, very high potential for water quality impacts, or a high level of public participation

The commission adopted Regulation 82, 401 Certifications, in November 1985 to implement the requirement in the Colorado Water Quality Control Act which became law on June 4, 1985. Regulation 82 was last updated in November of 2018 to clarify the process for certifying large water supply diversion projects. The regulation authorizes the division to certify, conditionally certify, or deny certification of federal permits and licenses. The 401 Water Quality certification program defines BMPs applicable to all certifications and procedures. When the

standard BMPs for the 401 water quality certification do not address the water quality impact, the division develops conditions to be included with the certification where necessary.

The certification process requires the division to perform a preliminary antidegradation review and draft certification determination of the project for public notice in the Water Quality Information Bulletin. Following the 30 day public comment period, the project is reviewed and evaluated with respect to the following:

- Any public comments received
- Applicable antidegradation rules
- Basic standards for surface water and groundwater
- Water quality classifications and standards.
- Applicable effluent limitations or control regulations
- BMPs to protect water quality
- Stormwater discharge requirements
- Any project specific special conditions

If it is determined that the project will comply with all applicable requirements, the division issues a regular certification for the federal permit or license. If the division concludes the project will comply with applicable requirements only if special conditions are placed on the permit or license, the division issues a conditional certification. If the division concludes that there is not reasonable assurance that the project will comply with applicable requirements even with the addition of special conditions, the certification is denied.

The division completed 17 401 water quality certifications in 2020-2021 in response to Section 404 individual permit applications to the U.S. Army Corps of Engineers.

The division has issued four conditional 401 Water Quality Certifications for large water supply projects since 2010. The first 401 certification was issued in 2010 for the Southern Delivery System in Colorado Springs. The second and third large water supply 401 water quality certifications were issued in 2016 for the Windy Gap Firming Project and the Moffat Collection Project, and more recently, in 2020, the division issued a 401 certification for the Northern Integrated Supply Project.

In September 2020, EPA promulgated a new 401 certification rule that introduced significant changes to the scope and process of 401 certifications. To date, Colorado has made no substantial changes to Regulation 82 or its internal processes as a result of this rule, and in May 2021, EPA announced its intent to reconsider the 2020 rule. The division will continue to monitor changes at the federal level and will respond with regulatory and process changes as necessary.

# Clean Lakes Program, Clean Water Act Section 314

Colorado has approximately 1,533 publicly owned lakes of greater than ten surface acres. The total surface acreage of these lakes has been estimated at 249,787. Significant publicly owned lakes are defined as those natural lakes, reservoirs, or ponds where the public has access to recreational activities such as fishing and swimming or where the classified uses such as water supply affect the public.

Section 314(a)(2) of the Clean Water Act requires states to report on the status of lake water quality as part of the 305(b) report. Colorado conducted lake assessments under the EPA lake water quality assessment assistance

grant between 1989 and 1994. Since 1995, Colorado has not received separate funding for lake and reservoir monitoring.

During this time (July 2019-June 2021) the division monitored 44 lakes and reservoirs. The lake and reservoir monitoring efforts provide data to evaluate the trophic status of Colorado lakes and reservoirs. The data are also used to assess attainment of water quality standards.

Trophic state is a classification of lakes based on the level of biological productivity (especially algae) and nutrient status. Commonly used indicators of nutrient status and productivity include the amount of algae as measured by chlorophyll-a, water transparency as measured by Secchi disk depth, and in-lake epilimnetic total phosphorus concentration. The trophic state is broadly defined as follows:

- Oligotrophic: lakes with few available nutrients and a low level of biological productivity; characterized by clear water; often supports cold water fish species
- Mesotrophic: lakes with moderate nutrient levels and biological productivity between oligotrophic and eutrophic; usually supports warmwater fish species
- Eutrophic: lakes with high nutrient levels and a high level of productivity; typically supports exclusively warmwater fish species
- Hypereutrophic: lakes in an advanced eutrophic state

Trophic status is an index of water quality only to the extent that trophic condition limits the desired use of a lake (i.e., water supply or recreation). Generally, the effects of lake eutrophication are considered to be negative, especially if the eutrophication is accelerated by human activities. Negative effects include taste and odor problems for water supplies; reduction in water clarity, which is important for many recreational uses; and a reduction in the dissolved oxygen (DO) concentration in bottom waters to levels that are lethal to fish. Eutrophication often leads to increased fish production, but at the expense of desired species that inhabit cold and deep areas, such as trout. Nutrients control the rate of algae productivity in lakes. While nutrients naturally occur in the environment and are necessary food for plants, when excess nutrients enter a lake as a result of human activities, eutrophication is accelerated. This can result in nuisance algae blooms and excessive plant growth.

The division uses the Trophic State Index (TSI) developed by OECD (Organization for Economic Co-Operation and Development, 1982) to estimate trophic state for each lake. Data for the epilimnion (upper-most layer in a stratified lake) collected during the growing season were used to calculate the mean chlorophyll-a for each lake monitored by the division in 2019 and 2020. Only lakes that had a minimum of three chlorophyll-a measurements within a summer were used for this assessment. Each lake's TSI was compared to the categories presented below (Table 19) to determine an overall trophic state.<sup>8</sup>

Table 19. Boundary values for trophic categories

Trophic Category	Chl a (µg/L)		
Ultra-Oligotrophic	≤1		
Oligotrophic	1-2.5		
Mesotrophic	2.5-8		
Eutrophic	8-25		
Hypereutrophic	≥25		

<sup>&</sup>lt;sup>8</sup> OECD, Eutrophication of Waters, Monitoring and Assessment, 1982

\_

A summary of the lake assessments can be found in Table 20. The trophic conditions for each lake are not used for regulatory purposes. A minimum of three chlorophyll measurements per summer are required to calculate the trophic status of lakes. Due to technical issues with the sampling boat in 2019, some lakes originally scheduled to be sampled three times each were only sampled two times each, a frequency that resulted in an insufficient sample size for determining the trophic status for these lakes. Lakes sampled only from shore due to boat engine problems or access constraints were also not included in this analysis.

Table 20. Trophic status of Colorado lakes monitored by the division in 2019-2020 (state fiscal year 20-21)

Lake	WBID	Elev. (ft)	Surface Acres	Avg. Chl a (µg/L)	Avg. Secchi (m)	Estimated Trophic Status	Year Monitored
Ridgway	COGUUN19	6,699	1.030	1.2	3.9	Oligotrophic	2019
Nighthorse	COSJAF22	6,882	1,490	0.42	7.3	Ultra-oligotrophic	2019
Electra	COSJAF22	8,330	1,100	1.6	6.25	Oligotrophic	2019
Prospect	COARFO07b	6,066	45	77.29	0.6	Hypereutrophic	2020
Windsor	COSPCP21	4,793	160	27.49	0.7	Hypereutrophic	2020
Skaguay	COARUA38	8,920	114	3.13	3.73	Mesotrophic	2020
Granby	COUCUC12	8,284	7256	1.8	4.03	Oligotrophic	2020
Pearl	COUCYA22	8,054	167	2.11	3.67	Oligotrophic	2020

<sup>\*</sup>Only lakes that had a minimum of three chlorophyll-a measurements were used for this assessment.

As part of the division's preparation for the annual water quality standard hearings, each quadrant of the state is the focus of the sampling efforts for a given year as shown in Table 21. In addition, every fifth year is devoted to revisiting lakes on the Monitoring and Evaluation List.

Table 21. Sampling lakes in the major river basins, keyed to the timing of basin hearings

Basin	Sampling Year	Hearing Year
Open (Basic Standards)	2018	2022
San Juan/ Gunnison	2019	2022

Upper/Lower Colorado	2020	2024
South Platte	2021	2026

Each summer, up to 10 lakes are chosen from the basin of focus to visit three times each through the growing season (July-September). Approximately 10 lakes from the basin of focus for the following year are also visited one time each during the sampling season to help with site selection for when this basin is the focus of monitoring efforts. Lakes are prioritized for the following reasons: 1) if the lake provides insight into water quality trends in the basin 2) if the lake is on the Monitoring and Evaluation List and 3) if the division has little or no data from a lake.

During the two-year period considered in this report (July 2019-June 2021), the division monitored 44 lakes. Many of these lakes were visited up to three times each. The lake and reservoir monitoring efforts provided data

to evaluate the trophic status of Colorado lakes and reservoirs. The data also were also used to assess attainment of water quality standards. As part of the lake assessments, the division also considers data collected by agencies other than the division. Routine monitoring of publicly owned reservoirs was performed by the USGS, Army Corps of Engineers, Denver Water, and various other entities, including cities, regional council of governments, and watershed basin authorities.

The primary purpose for monitoring lakes in Colorado is to assess if lakes are in attainment of their designated uses by comparing water quality measurements against applicable lake standards. If the division identifies water quality problems in the assessment of data collected with this program, formal action could result with placement of lakes on the 303(d) list of impaired waters or the Monitoring and Evaluation List (M&E). Figure 10 indicates the number of proposed lake listings for the 2022 303(d) List that are associated with each parameter. Approximately one third of the listings could potentially be attributed to nutrients (DO, DO (temp), pH, NH3, Chl-a).

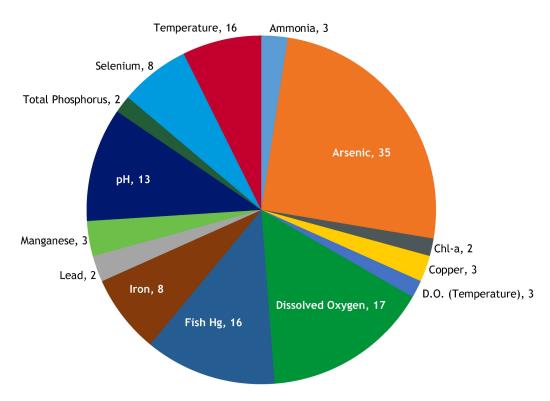

Figure 10. Number of lakes listed on the 2022 303(d) List for each parameter.

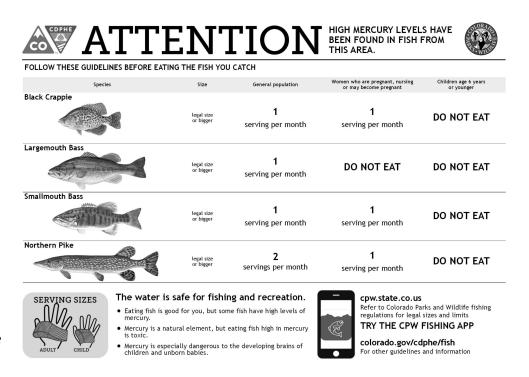

# Fish consumption advisory program

## **Background**

The Colorado fish consumption advisory program is overseen by a technical advisory committee made up of staff from the division, the Disease Control and Environmental Epidemiology Division, and from the Colorado Department of Natural Resources, Division of Parks and Wildlife. Committee members work together to develop sampling plans, analyze fish data, and communicate advisories. Colorado Parks and Wildlife biologists collect fish throughout the state, and the Division of Laboratory Services conducts the chemical analysis. Data collected through the fish consumption program, as well as data collected by other agencies within the state, is used to inform both attainment assessment and the state's fish consumption advisory program.

### Fish consumption advisories

Site-specific fish consumption advisories are currently issued for fish species in waterbodies where the weighted mean mercury of at least 10 samples is greater than or equal to 0.3 mg/kg. Some advisories were issued using previously employed methodologies. Advisories are retained until sufficient data can be assessed using the current methodology. The department has 28 active advisories based on this approach (approximately 20 percent of the tested water bodies), which are listed on the state's fish consumption dashboard. The state's fish

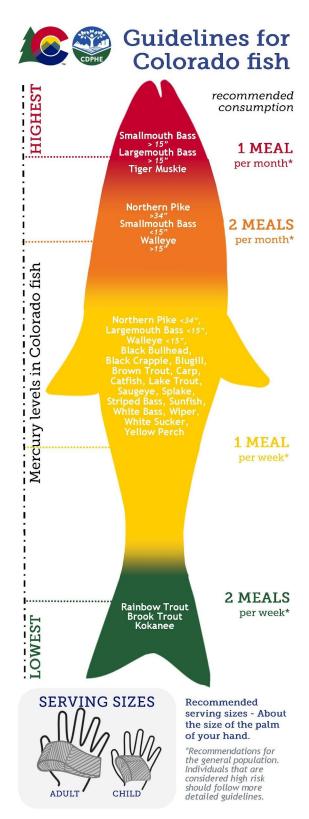

consumption website is currently being re-designed and will continue to serve as a hub for materials related to contaminants in fish and consumption advisories, providing general information on Colorado's fish consumption advisory program, mercury bioaccumulation, and assessment methodologies. The website also provides a link to the state fish consumption dashboard, which provides a list of all waterbodies from which fish have been tested as well as all results for contaminant levels in fish.

Fish tissue sample results were received from eight reservoir sites from July 2019 through June 2020, and fish tissue sample results were received from five reservoir sites from July 2020 through June 2021. A new fish consumption advisory based on elevated mercury levels was issued for Grand Lake in spring of 2020 and for Stagecoach Reservoir in spring of 2021. Additionally, adjustments were made in spring of 2021 to advisories for Echo Canyon Reservoir, Horsetooth Reservoir, and Lake Granby. The division maintains a strong working relationship with the Colorado Division of Parks and Wildlife aquatic biologists by providing rationales behind sampling site priorities, supporting biologists' efforts in the field, and modifying sampling priorities based on feedback from biologists.

### Statewide guidelines

Over the past 16 years, the division analyzed more than 6,000 fish tissue samples from Colorado to determine trends in mercury concentration throughout the state. Fish tissue data from this study and across the country show that larger, predator fish species tend to have higher levels of mercury compared to smaller species at the base of the food chain. Based on this trend, the technical advisory committee developed statewide guidelines for fish consumption using data from throughout the state. These statewide guidelines were created using weighted mean mercury levels for each individual species. The guidelines include fish meal recommendations by species for the general public and sensitive populations (children under six year of age and women who are pregnant or may become pregnant). This information is available to the public through distributed pamphlets and on the fish consumption advisory program website. The guidelines are displayed on a color coded graphic which lists common species and recommended meal frequencies.

Prior to 2012, the division assessed the impairment of aquatic life use classifications using a fish tissue action level of 0.5 ppm maximum mercury level. Since 2012, the division has been using a revised approach which compares the weighted mean mercury levels to a 0.3 mg/kg threshold. The division established a minimum data requirement of 30 samples to assess the attainment status of water bodies with elevated mercury levels. This ensures that 303(d) listings are based on statistically valid data sets. There are a total of 16 impaired waters due to fish tissue mercury according to the new methodology.

# Part D. Groundwater monitoring and protection

# Groundwater program

Groundwater is a vital resource for the people of Colorado. Approximately 20 percent of the state's population receives its drinking water from groundwater. The Colorado Water Quality Control Act gives the state authority for groundwater quality protection. Under the act, the primary responsibility for protecting groundwater is vested in the commission and the division.

A 1985 Executive Order articulated the state's groundwater protection goal: "The goal of the State of Colorado is to provide maximum beneficial use of the groundwater resources while assuring safety of the users by preventing or controlling activities that have the potential to impair existing or future beneficial uses of groundwater or to adversely affect public health."

A number of state agencies undertake varying groundwater assessment and protection roles. These agencies, referred to as groundwater standards implementing agencies, are charged with protecting groundwater under separate federal or state legislation. We discuss their roles and responsibilities below.

## Water Quality Control Division

The division regulates the discharge of pollutants into the state's surface and groundwater under the provisions of the Colorado Water Quality Control Act of 1974. Protection and maintenance is achieved by issuing permits specifying the types and amounts of pollutants discharged without violating the state water quality standards. The permits issued by the division to protect groundwater quality are primarily for the discharges to groundwater from domestic wastewater treatment facilities that have a design capacity of greater than 2,000 gallons per day. However, the division may also add groundwater standards to surface water discharges if they are hydrologically connected to groundwater. The division also permits discharges to groundwater that are not covered under the authority of another groundwater standards implementing agency.

## Agricultural Water Quality Program

The Agricultural Water Quality Program is a collaborative program between the Colorado Department of Agriculture, Colorado State University Extension, and the division. The Department of Agriculture is the lead agency for the program. The purpose of the program is to reduce negative impacts from agricultural chemicals on state waters and the environment. Agricultural chemicals covered under this legislation include commercial fertilizers and all pesticides. Program monitoring includes an approach to prioritize sampling in basins where agriculture predominates and rural homes utilizing groundwater. The program's website contains its groundwater quality data. In 2019, surface water monitoring authority was added to the program. The surface water

monitoring will start by examining the effects of agricultural BMPs on surface water quality and by monitoring nutrients to inform decisions about agricultural impacts on surface water as needed by Regulation 85. Regulation 85 is the commission's statewide control regulation for nutrient management in the state.

## Division of Oil and Public Safety

The Division of Oil and Public Safety (OPS) is an implementing agency for groundwater quality standards and classifications adopted by the commission for groundwater protection. The OPS has groundwater quality responsibilities under the Resource Conservation and Recovery Act (RCRA), Subtitle I of 1976, as amended. The OPS regulates the assessment and remediation of petroleum releases from underground and aboveground storage tanks within Colorado, which are predominately from commercial gasoline stations.

### Division of Reclamation, Mining and Safety

The Division of Reclamation, Mining, and Safety (DRMS) is an implementing agency for groundwater quality standards and classifications adopted by the commission for groundwater protection. The DRMS is responsible for mineral and energy development, policy, regulation, and planning under the Colorado Mined Land Reclamation Act and the Colorado Land Reclamation Act for the Extraction of Construction Materials. DRMS implements the commission's groundwater standards in permitted mining activities in the state, which include, but are not limited to, mineral mining, sand and gravel mining, and coal mining.

#### **Division of Water Resources**

The Division of Water Resources (DWR), also known as the Office of the State Engineer, is an implementing agency for groundwater quality standards and classifications adopted by the commission for groundwater protection. Functions of the DWR include the following:

- Administering water rights
- Issuing water well permits
- Representing Colorado in interstate water compact proceedings
- Monitoring streamflow and water use
- Approving construction and repair of dams and performing dam safety inspections
- Issuing licenses for well drillers and assuring the safe and proper construction of water wells
- Maintaining numerous databases of Colorado water and water well information

The Groundwater Commission also resides within DWR. In 2019, the division started a new consultation process with the Groundwater Commission for assisting in determining whether the source water used to recharge an aquifer will or will not cause unreasonable impairment of water quality.

#### Colorado Oil and Gas Conservation Commission

The Colorado Oil and Gas Conservation Commission (COGCC) is an implementing agency for groundwater quality standards and classifications adopted by the commission for groundwater protection.

COGCC issues permits for the drilling and operation of oil and gas wells, regulates production pit construction and operation, and enforces rules and regulations for the spacing of wells, wellbore construction, and well site reclamation. COGCC also enforces rules for the abandonment of oil and gas wells and the treatment and disposal of oil and gas production waste. COGCC rules implement the statutory charge to prevent significant environmental impacts to air, water, soil, or biological resources caused by oil and gas operations. COGCC also coordinates with the division on spill response and enforcement of these cases.

## Hazardous Materials and Waste Management Division

The department's Environment Hazardous Materials and Waste Management Division (HMWMD) is an implementing agency for groundwater quality standards and classifications adopted by the commission for groundwater protection. The HMWMD is responsible for administering the RCRA and related programs. HMWMD regulates solid

waste management, treatment and disposal facilities, and hazardous waste generation, storage, transportation, treatment, and disposal. HMWMD assists in the cleanup of hazardous waste sites, including CERCLA/Superfund sites and uranium mill tailings. Other programs include participation in brownfields redevelopment through the implementation of the Voluntary Cleanup and Redevelopment Act and cleanup assistance within the solid waste and hazardous waste programs, both federal and non-federal.

### Groundwater protection, notable activities during 2020-2021

- The division helped identify and adopt seven new specified areas spread across the state to cover injection wells regulated by COGCC rule 324(B). COGCC was directed by Senate Bill 19-181 to revise all of their regulations to increase focus on public health and environmental protections. The division spent a substantial amount of time coordinating with COGCC on efforts focused on making aquifer exemptions more protective, reducing some types of discharges to groundwater from pits, and standardizing analyte suites for characterizing groundwater.
- The division continued hosting the annual Groundwater Summit to facilitate discussions between all agencies with roles in protecting groundwater in Colorado. The Summit created a forum for agencies to share information and seek solutions from others working on similar issues and will provide future coordination on groundwater protection.
- The division has begun work on drafting a 10-year groundwater roadmap to guide future efforts and priorities associated with groundwater monitoring and assessment.

• Approximately 130 domestic wastewater treatment facilities (WWTFs) are authorized to discharge to groundwater in Colorado. In 2018, the division issued two new general permits (COX631000, COX634000) designed to provide renewed permit coverage for most of these systems. Along with these permits, the division developed and implemented a method to rank and prioritize the permit renewal efforts, increase the permit program's efficiency and transparency, and help communicate program resource constraints and accomplishments. To date, the division has renewed permit coverage for 82 WWTFs, or 64% of all WWTFs discharging to groundwater, resulting in increased protection for human health and the environment of Colorado. Over the next few years, the division will work to update and renew a third general permit designed to cover almost all of the remaining systems.

# Part E. Safe Drinking Water Program

The Safe Drinking Water Program ensures that public drinking water systems always provide safe drinking water to the citizens and visitors in the state. The program adopts and enforces regulations and provides assistance and incentives that further protect the quality of drinking water supplied by public drinking water systems. The Safe Drinking Water Program is housed within the division and administers two major federal statutes as authorized by Colorado law in the Clean Water Act and the Safe Drinking Water Act. The program also helps administer operator certification requirements adopted by the Water and Wastewater Facility Operator Certification Board.

The following sections comprise the Safe Drinking Water Program and provide related services to external entities:

- Compliance assurance section
- Engineering section
- Field services section
- Community development and partnership section

An organizational chart for the division is included in Figure 11 at the end of this section for better clarity.

## Compliance assurance section

The compliance assurance section is responsible for developing and maintaining Colorado's drinking water regulations and policies. The section also implements and enforces drinking water standards and monitoring and reporting requirements. They provide compliance assistance and training to the regulated public water systems and operators. Additionally, they respond to drinking water emergencies and follow up with systems about associated requirements and issues. Lastly, the section is responsible for managing self-report monitoring data and other information used to assess and track water systems' compliance with regulations and to provide infrastructure and related information that is critical to timely and effective response in emergency situations. This also includes responsibility for administration and maintenance of the program's database of record, the EPA Safe Drinking Water Information System, and the program's electronic data portal, which provides a secure, effective, and simple means for water systems and operators to submit information electronically.

### **Engineering section**

The engineering section operates under both the Safe Drinking Water Program and the Clean Water Program. Section activities include:

- Reviewing designs for drinking water treatment and storage
- Design and site location reviews for wastewater collection and treatment infrastructure projects
- Determining eligibility for state revolving loan fund projects
- Providing technical assistance to water and wastewater treatment systems and for enforcement related actions

- Responding to water treatment or distribution system failures and water quality/safety complaints/inquiries
- Evaluating disinfection treatment for public drinking water systems to ensure appropriate pathogen removal

### Field services section

The field services section is responsible for conducting field inspections of public water suppliers and permitted wastewater facilities. The types of inspections, frequency of inspections, and process for inspections are all done in accordance with applicable regulations. Depending on the specific findings during an inspection, the section typically will provide preliminary compliance assistance. The field services section is also responsible for responding to spills and for drinking water acute response situations.

### Community development and partnership section

This section provides technical, managerial, and financial assistance through three respective units: the local assistance unit, the grants and loans unit, and the source water and emerging contaminants unit.

The local assistance unit is responsible for providing training, technical assistance, and management support services directly to public water systems so they can strengthen their ability to supply safe drinking water to the public and eliminate the potential for waterborne diseases. Unit activities include:

- Coaching and assistance
- Capacity building
- Expert advice and assistance on operator certification policy and regulation
- Training
- Security and emergency response services
- Reports and publications
- Liaison to the Water and Wastewater Treatment Facility Operator Certification Board

The grants and loan unit is responsible for working with communities to assist with water and wastewater project development to better protect public health and the environment. The unit also manages a number of state grant programs along with the federal State Revolving Loan Fund Programs that offer subsidized financing to support these water-related projects. Part C of this report discusses the State Revolving Loan Fund Program in more detail.

The source water and emerging contaminants unit provides training, technical assistance, and management support services to public water systems so they can strengthen their ability to supply safe drinking water to the public. Unit activities include:

- Facilitation of the completion and implementation of source water protection plans
- Administration of the state and federal public school lead testing programs
- Emerging contaminant support with respect to guidance and policy development
- Drinking water acute response

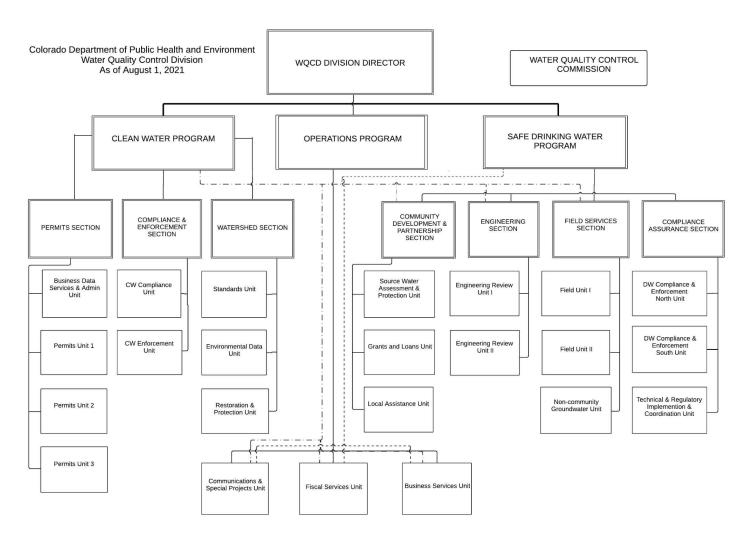

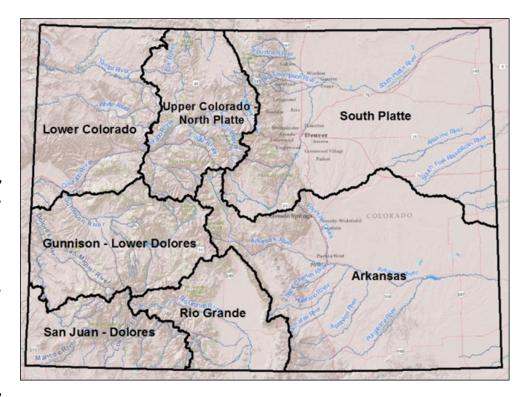

Figure 11. Water Quality Control Division organizational chart.

## Part F. Basin summaries

This section provides an overview of the beneficial use attainment for the commission's seven water quality standard regulated basins: Arkansas, Upper Colorado and North Platte, San Juan and Dolores, Gunnison and Lower Dolores, Rio Grande, Lower Colorado, and South Platte.

Colorado forms a nearly perfect square and encompasses 104,247 square miles, or over 66.7 million acres. Colorado's geography is diverse, ranging from rugged, mountainous terrain to foothills, plains, plateaus,

mesas, and canyons. The state's ecological diversity is enormous. The Continental Divide runs in a north/south direction along the Rocky Mountains through west-central Colorado, creating a western slope and an eastern slope. Colorado's mean elevation is 6,800 feet. Its highest point is Mt. Elbert at 14,433 feet, southwest of Leadville; its lowest point is at 3,315 feet on the Arikaree River at the Kansas border. Mt. Elbert is the 14th highest peak in the United States, including mountain peaks in Alaska. There are 58 mountain peaks in Colorado over 14,000 feet high and more than 1,000 over 10,000 feet high.

As previously mentioned, Colorado is home to seven major river basins. Four of the seven rivers (Arkansas, South Platte, Republican, and Rio Grande) flow east from the Continental Divide toward the Gulf of Mexico. The remaining three rivers—the Colorado, Green/Yampa/White, and San Juan—flow west of the Continental Divide toward the Pacific Ocean. The headwaters of six of the seven rivers—Arkansas, Colorado, Green/Yampa/White, South Platte, Rio Grande, and San Juan—originate in Colorado's mountains. The Green River flows into the northwest corner of Colorado for only a short stretch. The Yampa and White Rivers originate in the Flat Top Mountains and join the Green River near the Colorado-Utah state line. The Republican River starts in the plains of Colorado, just east of the Colorado-Nebraska state line.

<sup>&</sup>lt;sup>11</sup> Colorado State Archives. 2001. Colorful Colorado Geography. Denver, CO.

### Arkansas River Basin

The Arkansas River Basin includes waterbodies in the following counties: Lake, Chaffee, Custer, Fremont, El Paso, Pueblo, Huerfano, Las Animas, Otero, Bent, Prowers, Baca, Kiowa, Cheyenne, Lincoln, Teller, and Elbert. Major segments within the basin include the Arkansas River, Pueblo Reservoir and Fountain Creek.

The Arkansas River is the sixth longest river in the United States at approximately 1,460 miles. <sup>12</sup> It begins in Colorado's central Rocky Mountains and flows generally to the east and southeast through the

Great Plains of Kansas, northern Oklahoma, and Arkansas. The river is spatially the largest river in Colorado, covering 27 percent of the state's surface area, an area of 28,268 square miles. The river begins at Mt. Elbert, which is at 14,433 feet, and its tributaries begin near Leadville, Colorado (Lake County). The river drops to 3,340 feet at the Colorado-Kansas state line, near the town of Holly in Prowers County. The elevation change is more than 11,000 feet.

The northwestern portion of the Arkansas River Basin consists of steep mountain slopes, some wetlands, glaciated lakes, and high-gradient headwater and perennial streams. The river gushes through the steep valleys of the Rockies, dropping 4,600 feet in 120 miles. The Arkansas River valley widens and flattens markedly at Canon City, Colorado. Just west of Pueblo, Colorado, the Arkansas River enters the High Plains. There, the river has wide, shallow banks. This region has intermittent streams and a few large perennial streams that originate in the mountains. Land ownership in the Arkansas River Basin is predominantly private (70 percent), followed by the federal government (20 percent) and the state (10 percent).

#### Assessment results

For the Arkansas River Basin, 97 percent of the river miles and 67 percent of the lake acres have been assessed; 31 percent of the river miles and 22 percent of the lake acres are fully supporting all uses. An additional 0.53 percent of the river miles, and 0.28 percent of the lake acres, are supporting some of the classified uses. The individual use support is summarized in Table 22. Arsenic, *E.coli*, selenium and manganese are the most common listings for rivers and streams; selenium, arsenic, and dissolved oxygen are the most common listings for lakes and reservoirs.

Table 22. Impairment summary for the Arkansas River Basin

EPA IR Category	Rivers & streams (miles)	Lakes & reservoirs (acres)

### Upper Colorado and North Platte River Basin

The Upper Colorado and North Platte River Basins include the Colorado River, the Yampa River, and the North Platte River. The principal tributaries include the Fraser River, Blue River, Eagle River, Gore Creek, Roaring Fork, Snake, and Little Snake Rivers. Major reservoirs in this basin include Dillon Reservoir, Grand Lake, and Lake Granby.

Elevations in the Colorado River Basin range dramatically from 13,000 feet at the headwaters to approximately 4,300 feet at the Colorado-Utah state line, where the Colorado River exits the state. The Colorado River's headwaters are within Rocky Mountain National Park. From there, the river flows southwest for approximately 230

miles through Grand, Eagle, Garfield, and Mesa Counties before exiting the state into Utah.

Colorado Parks and Wildlife has designated the Blue River from Dillon Reservoir Dam to the Colorado River, Gore Creek from Red Sandstone Creek to Eagle River, the Colorado River from the Fraser River to Troublesome Creek, the Fryingpan River from Ruedi Reservoir Dam to the Roaring Fork River, and the Roaring Fork River from the Fryingpan River to the Colorado River as gold medal fisheries and considers them areas of high recreational value.

#### Assessment results

For the Upper Colorado and North Platte River Basin, 92 percent of the river miles and 92 percent of the lake acres have been assessed; 44 percent of the river miles are fully supporting all classified uses, with an additional 3.13 percent supporting at least one of the classified uses. For lakes within this basin, 45 percent of the lake acres are fully supporting all classified uses. The individual use support for the Upper Colorado and North Platte River Basin is summarized in Table 23. Arsenic, temperature, and zinc are the most common listings for rivers and streams; arsenic, temperature, and mercury in fish are the most common listings for lakes and reservoirs.

Table 23. Impairment summary for the Upper Colorado River and North Platte River Basin

	EPA IR Category	Rivers and streams (miles)	Lakes and reservoirs (acres)

4b	Impaired, no TMDL necessary	0	0
4c	Impairment is not caused by pollutant	0	0
5	Impaired, TMDL necessary	2,142	9,005

### San Juan and Dolores River Basin

The San Juan and Dolores Rivers in southwestern Colorado are both tributaries to the Colorado River. The principal tributaries of the San Juan River are the Animas, Florida, La Plata, Los Pinos, Mancos and Piedra Rivers. The main tributary of the Dolores River is the San Miguel River, which originates in Gunnison and Lower Dolores River Basins. The San Juan River and tributaries pass through the Ute Mountain Ute Indian Reservation and the Southern Ute Indian Reservation before exiting the state. The major population areas are Cortez, Durango, and Pagosa Springs. Major reservoirs in the San Juan basin include McPhee Reservoir, Vallecito Reservoir, and Narraguinnep Reservoir.

Elevations in the San Juan River system range from greater than 14,000 feet in headwater areas of the Animas and Los Piños rivers down to 4,500 feet, where the Mancos River exits the state just east of the Four Corners into New Mexico.<sup>14</sup> The river basin is also home to five ski areas: Telluride, Wolf Creek, Ski Hesperus, Silverton Mountain, and Purgatory Mountain Resort.

The sedimentary rocks in the region include pockets of coal, oil, and uranium. Historically, the area was also mined for gold, silver, and copper.

#### Assessment results

For the San Juan River and Dolores River Basin, 93 percent of the river miles and 87 percent of the lake acres have been assessed; 53 percent of the river miles and 7.8 percent of the lake acres are fully supporting all uses. An additional 4 percent of the lake acres are supporting some of the classified uses. The individual use support is summarized in Table 24. Arsenic, total iron, manganese, and sulfate are the most common listings for rivers and streams; temperature, mercury in fish, arsenic, and pH are the most common listings for lakes and reservoirs.

Table 24. Impairment summary for the San Juan River and Dolores River Basin

4c	Impairment is not caused by pollutant	0	0
5	Impaired, TMDL necessary	996	12,831

<sup>&</sup>lt;sup>14</sup> Colorado Water Conservation Board. 2004. Statewide Water Supply Initiative. Colorado Department of Natural Resources, Colorado Water Conservation Board, Denver, Colorado.

### Gunnison and Lower Dolores River Basin

The Gunnison and Lower Dolores River Basin includes all or parts of Gunnison, Delta, Montrose, Ouray, Mesa, Saguache, and Hinsdale Counties. Major tributaries are the Slate River, Uncompanyere River, and the San Miguel River. Major reservoirs in the Gunnison and Lower Dolores Basin include Blue Mesa Reservoir, Sweitzer Lake, Paonia Reservoir, Ridgway Reservoir, and Fruitgrowers Reservoir.

The Gunnison River originates at Almont, Colorado, at the confluence of the Taylor and East Rivers. It then flows past the city of Gunnison and passes through the Blue Mesa, Morrow Point, and Crystal Reservoirs. The Gunnison River then meets the North Fork of the Gunnison River west of

the town of Hotchkiss. The Uncompandere River is a major tributary to the Gunnison River; it joins the Gunnison near the town of Delta. <sup>15</sup> The Gunnison River alone has elevation changes greater than 9,500 feet from the headwaters to the Uncompandere Plateau in the southwest portion of the basin. <sup>16</sup> <sup>17</sup>

#### Assessment results

For the Gunnison and Lower Dolores River Basin, 90 percent of the river miles and 67 percent of the lake acres have been assessed; 47 percent of the river miles and 20 percent of the lake acres are fully supporting all uses. An additional 0.12 percent of the river miles are supporting some of the classified uses. The individual use support is summarized in Table 25. Arsenic, total iron, and manganese are the most common listings for rivers and streams; temperature, dissolved oxygen, pH, and total iron are the most common listings for lakes and reservoirs.

Table 25. Impairment summary for the Gunnison River and Lower Dolores River Basin

### Rio Grande River Basin

The Rio Grande Basin is located in south-central Colorado and covers 7,700 square miles. The basin ranges from over 14,000 feet above sea level in the Sangre de Cristo Mountains to 7,400 feet above sea level where the Rio Grande crosses the Colorado-New Mexico border. The Rio Grande Basin encompasses approximately 7,500 square miles, including the San Luis Valley. The river's headwaters are in the San Juan Mountains near the Continental Divide, from which it flows southeasterly.

The river's south fork and mainstem join on the west side of the valley at the town of South Fork, Colorado. The river then flows to the east through the town of Del Norte and continues southeast across the valley through the cities of Monte Vista and Alamosa, Colorado. At Alamosa, the river turns south and runs nearly 40 miles, passing through a break in the San Luis Hills and then entering a deep canyon above the New Mexico state line. <sup>18</sup> Major reservoirs in the Rio Grande Basin include Rio Grande Reservoir, La Jara Reservoir, Platoro Reservoir, Continental Reservoir, and the San Luis Lake.

The San Luis Valley is an open, nearly treeless, inter-montane valley. It is the predominant feature of the Rio Grande Basin.<sup>19</sup> In size, the San Luis Valley extends approximately 90 miles from north to south and 50 miles from east to west. The valley floor ranges in elevation from 7,512 feet to about 8,000 feet, and it is ringed by mountains between 10,000 feet to 14,390 feet in elevation.<sup>20</sup>

An area known as the closed basin occupies the northern part of the San Luis Valley. A low topographic divide and a hydrologic divide separate groundwater in the closed basin from that in the rest of the valley. The divide extends southeast from near Del Norte, Colorado, to a few miles north of Alamosa, Colorado and then to the east side of the San Luis Valley. The principal tributary to the Rio Grande in Colorado is the Conejos River.

#### Assessment results

For the Rio Grande Basin, 79 percent of the river miles and 58 percent of the lake acres have been assessed; 44 percent of the river miles are fully supporting all classified uses. For lakes within the Rio Grande Basin, 32 percent of the lake acres are fully supporting all classified uses. The individual use support for the Rio Grande Basin is summarized in Table 26. Arsenic, total iron, and temperature are the most common listings for rivers and streams; dissolved oxygen and total iron are the most common listings for lakes and reservoirs.

### South Platte River Basin

The South Platte River Basin covers approximately 21,000 square miles in northeastern Colorado. The North and South Platte Rivers join in Nebraska to form the Platte River. The South Platte River has the largest population of any river basin in Colorado, with almost 70 percent of the state's population. The major tributaries of the South Platte are Bear Creek, Cherry Creek, Clear Creek, Boulder Creek, St. Vrain River, Big Thompson River, and the Cache La Poudre River. Major reservoirs in the South Platte River Basin include Cherry Creek Reservoir, Chatfield Reservoir, Barr Lake, and Horsetooth Reservoir.

The South Platte River originates southwest of Denver and flows through the Denver metropolitan area and into the high plains region of Colorado. Elevations in the Platte River Basin range from 14,000 feet in the headwater regions to approximately 3,400 feet in the high plains region.<sup>21</sup> <sup>22</sup>

#### Assessment results

For the South Platte River Basin, 96 percent of the river miles and 62 percent of the lake acres have been assessed; 65 percent of the river miles are fully supporting, with an additional 0.84 percent supporting at least some of the uses. For lakes within the South Platte River Basin, 39 percent of the lake acres are fully supporting all classified uses; a further 1.58 percent of the lake acres are supporting at least some of the classified uses. The individual use support for the South Platte River Basin is summarized in Table 27. Arsenic, E.coli, and copper are the most common listings for rivers and streams; arsenic, dissolved oxygen, and pH are the most common listings for lakes and reservoirs.

### Lower Colorado River Basin

The Lower Colorado River Basin covers all of Garfield, Rio Blanco, Moffat, and portions of Mesa and Routt Counties. Major tributaries include the Lower Yampa River, Green River, and White River.

Major population centers are in Grand Junction, Craig, Rangely, and Rifle. The Lower Colorado River basin encompasses approximately 17,830 square miles and includes drainages for the Yampa River, White River, and Gunnison River.

The Colorado River Basin has a greater combined flow than all of the other river basins in Colorado. The Elk Mountain Range separates the

Colorado River drainage from the Gunnison River drainage. The Colorado River and its tributaries drain approximately 9,830 square miles, and the Colorado River alone accounts for approximately 44 percent of the water leaving the state. The Gunnison River and its tributaries drain approximately 8,000 square miles.<sup>23</sup>

#### Assessment results

For the Lower Colorado River Basin, 94 percent of the river miles and 54 percent of the lake acres have been assessed; 68 percent of the river miles are fully supporting, with an additional 1.1 percent supporting at least some of the uses. For lakes within the Lower Colorado River Basin, 28 percent of the lake acres are fully supporting all classified uses. The individual use support for the Lower Colorado Basin is summarized in Table 28. Arsenic, total iron and selenium are the most common listings for rivers and streams; arsenic, temperature, and mercury in fish are the most common listings for lakes and reservoirs.

# Appendix A

# Definitions and concepts

The Use Attainment Table for Streams and Rivers (Appendix A) uses the five category system to classify all waterbodies in the state. These categories are first applied to individual analytes and classified uses within Regulation 93. This can result in multiple reporting categories within a single assessment unit. In these cases, a hierarchical system is used to apply a single reporting category to an assessment unit (see the order of hierarchy diagram below). Typically, the overall highest category number/letter designation for all the classified uses is assigned to the assessment unit as the reporting category.

### Order of hierarchy

#### Classified use attainment definitions

	Term	Definition
F	Fully supporting	Classified uses are supported Category 1
ı	Insufficient Information	Insufficient data to determine attainment (M&E List) Category 3b
N	Not Supported	At least one classified use is not being supported Categories 4 & 5
Х	Not Assessed	No water quality data has been collected Category 3a
NA	Not Applicable	A classified use is not assigned to this segment

## Appendix B

## Definitions and concepts

The Use Attainment Table for Lakes and Reservoirs (Appendix B) uses the five category system to classify all waterbodies in the state. These categories are first applied to individual analytes and classified uses within Regulation 93. This can result in multiple reporting categories within a single assessment unit. In these cases, a hierarchical system is used to apply a single reporting category to an assessment unit (see the order of hierarchy diagram below). Typically, the overall highest category number/letter designation for all the classified uses is assigned to the assessment unit as the reporting category.

### Order of hierarchy

#### Classified use attainment definitions

	Term	Definition
F	Fully supporting	Classified uses are supported Category 1
ı	Insufficient Information	Insufficient data to determine attainment (M&E List) Category 3b
N	Not Supported	At least one classified use is not being supported Categories 4 & 5
X	Not Assessed	No water quality data has been collected Category 3a
NA	Not Applicable	A classified use is not assigned to this segment

3a. All tributaries to Fountain Creek which are within the boundaries of National Forest or Air Force Academy lands, including all wetlands, from a point immediately above the confluence with Monument Creek to the confluence with the Arkansas River, except for the mainstem of Monument Creek in the Air Force Academy lands and specific listings in segment 3b.

#### Listed portion:

COARFO03a\_B West Monument Creek and tributaries

Affected Use	Analyte	Category / List	Priority
Aquatic Life Use	Macroinvertebrates (Provisional)	5 303(d) list	L

#### Listed portion:

COARFO03a\_C Tributaries and wetlands to Cheyenne Creek not within National Forest boundaries. Bear Creek below Gold Camp Road to the confluence with Fountain Creek. Rock Creek from the National Forest boundary to Highway 115. North Monument and Beaver creeks from the source to the confluence with Monument Creek.

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

#### COARFO04a

4a. Mainstems of Jackson Creek, Monument Branch, Elkhorn Springs, Pine Creek, South Pine Creek, South Rockrimmon Creek, Templeton Gap North, Templeton Gap Floodway, Douglas Creek and South Douglas Creek, from the sources to confluences with Monument Creek, including all tributaries and wetlands, which are not within the boundaries of the National Forest or Air Force Academy lands.

#### Listed portion:

COARFO04a\_A Mainstem of Jackson Creek, Monmument Branch, Elkhorn Springs, Pine Creek, South Pine Creek, South Rockrimmon Creek, Templeton Gap North, Templeton Gap Floodway, Douglas Creek, and South Douglas Creek, from the sources to the confluences with Monument Creek.

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

#### COARFO04b

4b. All tributaries to Monument Creek from the sources to the confluences with Monument Creek which are not within the boundaries of National Forest or Air Force Academy lands, including all wetlands, from a point immediately below the confluence with North Monument Creek to the confluence with Fountain Creek, except for specific listings in segments 3a, 4a and 4c. This includes Dirty Woman Creek, Smith Creek, Black Squirrel Creek, Cottonwood Creek, Dry Creek and an unnamed tributary with the confluence at Monument Creek located near (38.948613, -104.829623).

#### Listed portion:

COARFO04b\_A All tributaries to Monument Creek from the sources to the confluences with Monument Creek which are not within the boundaries of National Forest or Air Force Academy lands, including all wetlands, from a point immediately below the confluence with North Monument Creek to the confluence with Fountain Creek, except for specific listings in segments 3a, 4a, and 4c. This includes Dirty Woman Creek, Smith Creek, Black Squirrel Creek, Cottonwood Creek, Dry Creek, and an unamed tributary with the confluence at Monument Creek located near

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

(38.948613, -104.829623).

#### COARFO04c

4c. Mainstems of Kettle Creek, North Rockrimmon Creek and Mesa Creek, including tributaries and wetlands, from the sources to confluences with Monument Creek.

#### Listed portion:

COARFOO4c A Mainstems of Kettle Creek, North Rockrimmon Creek and Mesa Creek, including all tributaries and wetlands, from the sources to the confluences with Monument Creek.

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

#### COARFO04d

4d. All tributaries with confluences with Fountain Creek from South Academy Blvd (CO83) to and including the unnamed tributary immediately south of Old Pueblo Road (38.585843, -104.669591), including tributaries and wetlands, except for Little Fountain Creek and its tributaries and wetlands, and specific listings in segments 3a, 5a and 5b. All tributaries with confluences with Fountain Creek from a point immediately above University Blvd (CO47) (38.312846, -104.590524), to the confluence with the Arkansas River.

#### Listed portion:

COARFO04d\_A All tributaries with confluences with Fountain Creek from South Academy Blvd (CO83) including the unnamed tributary immediately south of Old Pueblo Road (38.585843, -104.669591), including tributaries and wetlands, except for Little Fountain Creek and its tributaries and wetlands, and specific listings in segments 3a, 5a, and 5b. All tributaries with confluences with Fountain Creek from a point immediately above University Blvd (CO47) (38.312846, -104.590524) to the confluence with the Arkansas River.

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

#### COARFO04e

4e. All tributaries to Fountain Creek, including tributaries and wetlands, from a point immediately below the confluence with Monument Creek to University Blvd (CO47) near Pueblo except for specific listings in 3a, 4d, 5a and 5b.

#### Listed portion:

COARFO04e\_A All tributaries to Fountain Creek, including tributaries and wetlands, from a point immediately below the confluence with Monument Creek to University Blvd (CO47) except for Little Fountain Creek, Sand Creek(s) (near Wigwam and Colorado Springs), and specific listings in segments 5 and 6.

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

#### Listed portion:

COARFO04e\_B Sand Creek (near Wigwam), including all tributaries and wetlands.

Affected Use	Analyte	Category / List	Priority
Aquatic Life Use	Selenium (Dissolved)	3b M&E list	NA
Recreational Use	E. coli	5 303(d) list	Н

#### Listed portion:

COARFO04e\_C Sand Creek (near Colorado Springs), including all tributaries and wetlands.

Affected Use	Analyte	Category / List	Priority
Water Supply Use	Sulfate	3b M&E list	NA
Aquatic Life Use	Selenium (Dissolved)	5 303(d) list	Н

#### Listed portion:

COARFO04e\_E Little Fountain Creek, including all tributaries and wetlands, from immediately below Deadman Canyon to the confluence with Fountain Creek.

Affected Use	Analyte	Category / List	Priority
Aquatic Life Use	Selenium (Dissolved)	3b M&E list	NA
Recreational Use	E. coli	5 303(d) list	Н

#### COARFO05a

5a. Jimmy Camp Creek, including all tributaries and wetlands from the source to Old Pueblo Road (38.673200, -104.696739). Williams Creek, including all tributaries and wetlands, from the source to the confluence with Fountain Creek.

#### Listed portion:

COARFO05a\_A Jimmy Camp Creek, including all tributaries and wetlands from the source to the irrigation diversion east of Old Pueblo Road (38.694, -104.683). Williams Creek, including all tributaries and wetlands, from the source to the confluence with Fountain Creek

Affected Use	Analyte	Category / List	Priority
Recreational Use	E. coli	5 303(d) list	Н

Listed portion:	COARFO05a_B Jimmy Camp Creek, including all tributaries and wetlands from the irrigation diversion eas Old Pueblo Road (38.694, -104.683) to Old Pueblo Road (38.6732, -104.696739).
