G. Pronghorn Herds (DAUs) Over Objective

H. Pronghorn Herds (DAUs) Below Objective

GAME DAMAGE PROGRAM

Section A: Game Damage Compensation

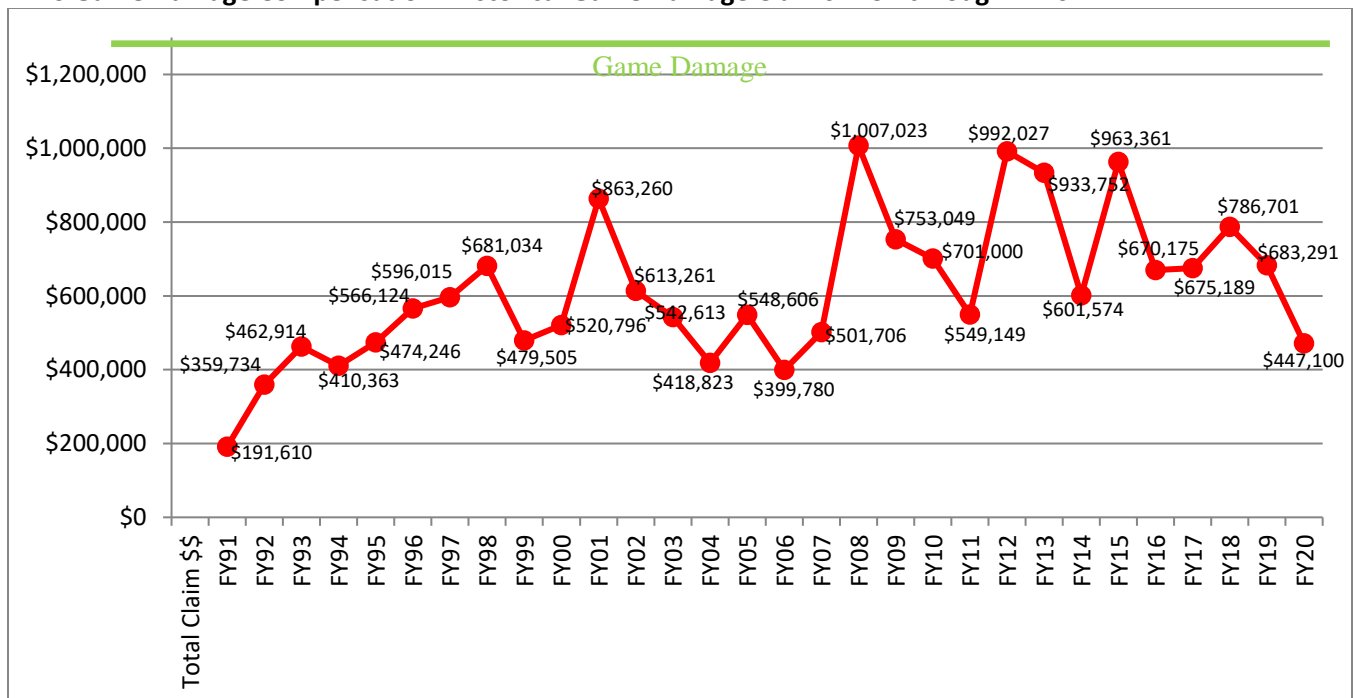

Annual Allocation for Claims & Prevention	\$1,282,500
FY20 Expenditures for Claims	\$ 447,100

Colorado's game damage program is authorized in Article 3 of Title 33 Colorado Revised Statutes. Since its original inception over 90 years ago, the program's goal of mitigating and compensating agricultural producers for damage suffered by big game wildlife has changed very little. Over the years, the program has been refined most notably through the integration of the prevention materials program. The Game Damage program is funded entirely by license revenues through an annual appropriation from the Game Cash fund. The FY20 line item appropriation was \$1,282,500. This appropriation funds the two key program components; damage compensation and damage prevention materials. Resources are utilized among each program component based on annual needs.

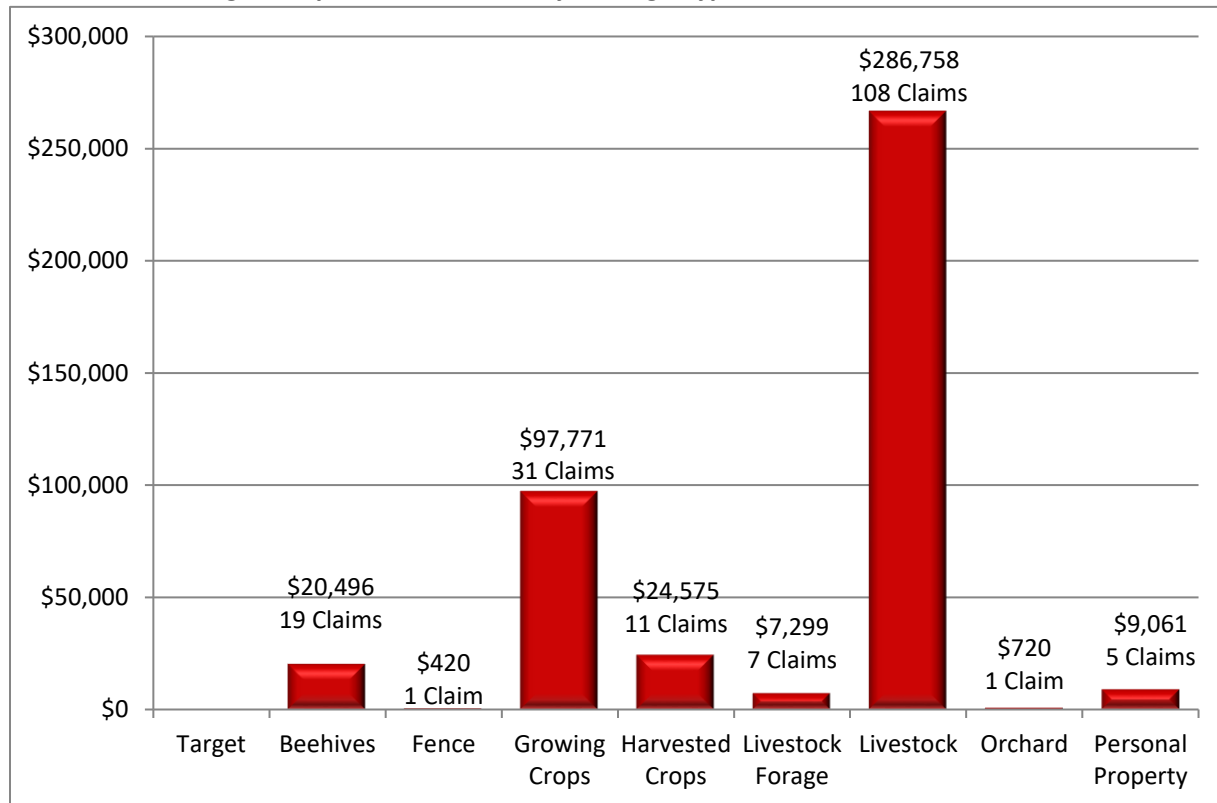

FY20 Game Damage Compensation - Overview

The compensation component of the game damage program provides reimbursement for qualifying agricultural claimants suffering eligible losses caused by big game wildlife. In FY20, compensation costs amounted to \$447,100 in settlement of 183 claims. These costs are ~\$308,644 below the past 5-year average of \$755,744 (FY15-FY19), a 40.84% decrease. This decrease is largely attributed to fewer and lower claims for bear depredation on livestock and a 33% reduction in growing crop claim compensation compared with last year. The total number of claims paid (n=183) in FY20 was below the past 5-year average of 236. CPW denied two claims total in FY20 (1.1% of all claims filed).

FY20 Game Damage Compensation – Denials

Area	Damage Type	Claim Request	Basis for Denial
2	Ornamental Trees by Elk	\$5,600.00	Regulation #1700(G) – Did not qualify for Orchard claim; did not meet criteria Regulation #1740.A – No preponderance of evidence damage caused by big game wildlife (Elk)
15	Corn by Elk	\$5,696.69	Regulation #1760(A)(2) – No proof by a preponderance of evidence that big game did damage to his crops #1731(A) – Proof of Loss forms shall be submitted within 90 days of the last notification

Section B: Game Damage Prevention Materials

Annual Allocation for Claims & Prevention	\$1,282,500
FY20 Expenditures for Permanent Prevention Materials	\$ 206,346
(Includes Apiary Fencing Materials)	
FY20 Expenditures for All Other Temporary Prevention Materials	\$ 58,660
TOTAL FY20 Expenditures for Permanent and Temporary Prevention Materials	\$ 265,006

The damage prevention materials program became an integrated component of the Game Damage Program over 20 years ago. The prevention materials component provides both permanent and temporary materials to landowners to eliminate or minimize damage caused by big game wildlife. Apiary fencing, orchard fencing and stackyard fencing comprise the majority of the requests for materials.

FY20 Game Damage Materials – Overview

Total expenditures for damage prevention materials (\$265,006) in FY20 decreased by 22.25% compared to the past 5-year average (\$340,825), and the number of deliveries (n=164) decreased by 29.73% from the past 5-year average (n=233.4). Stackyard requests (n=34) were below the past 5-year average by 25.55% (n=45.6). Apiary fence requests (n=105) were below the past 5-year average by 17.1% (n=126.6).

FY20 Game Damage Materials – Multi-Year Overview

FY20 Game Damage Materials – Summary

The Game Damage Program filled 164 requests for Prevention Materials throughout the state.

Over 96 miles of permanent fencing were delivered. Game Damage also delivered 55 apiary fences, while an additional 50 requests were filled from caches located at Area offices. Deliveries required traveling more than **51,104** miles. The game damage technicians worked several efficiencies into route planning, netting a savings of over 10,000 miles, along with a reduced number of deliveries.

Game Damage delivered pyrotechnics and 8 x 8 wood panels to Area offices in order to provide landowners with temporary prevention materials more efficiently.

The Habitat Partnership Program (HPP) requested materials for cooperative habitat or fencing projects with landowners. Game Damage delivered **\$52,147** worth of materials for **16 HPP** projects, which was reimbursed to the Game Damage Program.

Area offices requested nuisance bear deterrent materials. Game Damage provided the deterrents, worth **\$19,813** in FY20, which was reimbursed by the Areas. Fencing materials were also provided to State Wildlife Areas at a cost of **\$37,665** for 5 projects, which was reimbursed to Game Damage.

Facility Type	Number of Deliveries	FY20
Apiary	105	\$46,970
Commercial Garden	8	\$28,323
Nursery	4	\$22,835
Orchard	10	\$43,364
Stackyard	34	\$55,981
Vineyard	2	\$4,839
Unique Fencing	1	\$4,034
PERMANENT MATERIALS & APIARY FENCES Total	164 deliveries	\$206,346
TEMPORARY MATERIALS for distribution by area offices		
Pyrotechnics	18	\$14,133
Wood Elk Panels (1328 Panels)	10	\$44,527
		\$265,006

DELIVERY TIME SPANS

Effective July 1, 2009: Senate Bill 09-024 required delivery within 15 business days for temporary materials or 45 days for permanent materials from initial request.

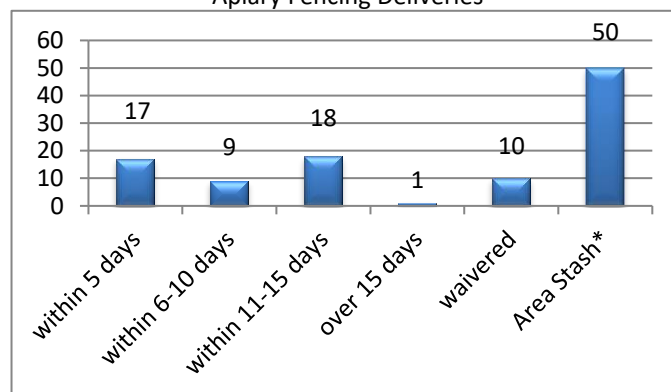

Apiary fencing requests, which are considered temporary fencing, were delivered on time, as mandated in statute (n=55). Only 1 apiary fence was delivered late; the material was given to the DWM to deliver, at his request. The remaining 10 deliveries were requested to be delivered later than 15 business days.

* - Deliveries from Apiary caches were filled on the same day as the landowner requests.

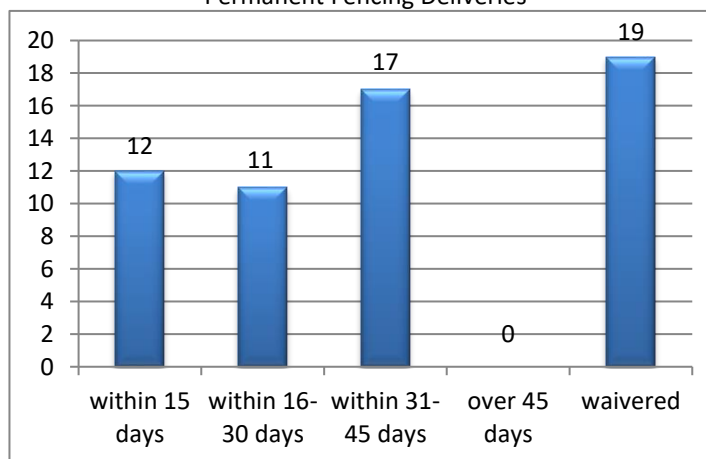

All deliveries for permanent game damage materials (n=59) were made within the 45 day limit or the deadline date was waived by the landowner.

- Zero (0) requests were delivered after the 45 day deadline.
- Nineteen (19) landowners requested the delivery date past 45 days via waiver.

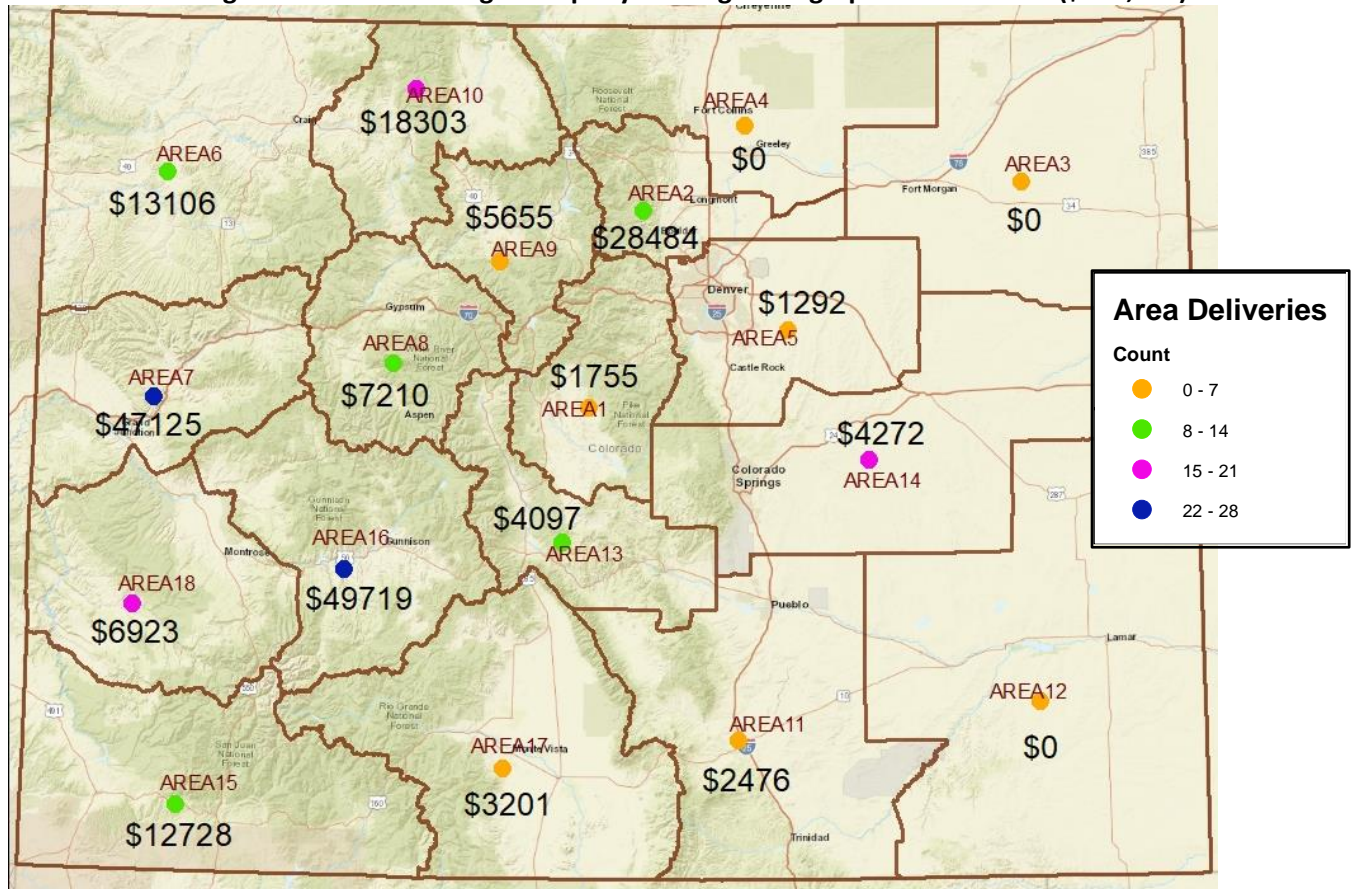

Apiary Fencing Deliveries

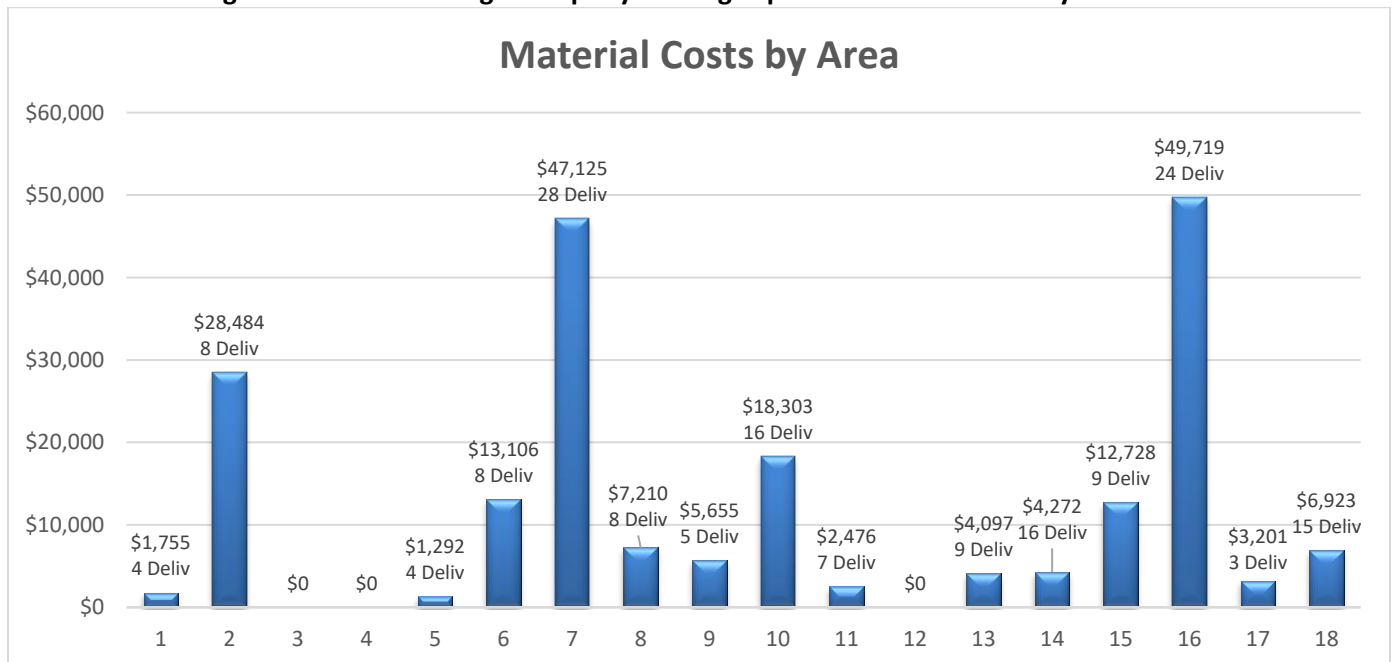

Permanent Fencing Deliveries

FY20 Game Damage Permanent Fencing and Apiary Fencing – Geographic Distribution (\$206,346)

FY20 Game Damage Permanent Fencing and Apiary Fencing Expenditure – Deliveries by Area

Section C: Permits Issued to Take Wildlife Pursuant to Section 33-3-106:

CPW Areas issued 13 permits during the Fiscal Year to kill specified numbers of wildlife causing excessive damage to property by request of the property owner. Thirty-seven animals were harvested, including 20 elk, 11 mule deer and 6 whitetail deer. There were no permits reported as being denied by CPW.

Area	No. Permits	Number and species
5	2	0 elk
6	3	9 elk
10	2	2 elk
14	2	2 mule deer, 6 whitetail deer
15	1	3 elk
17	1	5 elk
18	2	9 mule deer, 1 elk
TOTAL	13	20 elk, 11 mule deer, 6 whitetail deer

Part 2 - STATUS OF BIG GAME POPULATIONS

A. Background

Several processes guide big game management in Colorado, all of which are approved by the Colorado Parks and Wildlife Commission. Herd Management Plans (HMPs) establish long-term objectives for each big game species and herd. This is accomplished through a public process, using the best available scientific information on populations and habitat conditions. Big Game Season Structure (BGSS) policies define a 5-year framework for achieving HMP objectives through a variety of hunting opportunities and seasons. Finally, license recommendations are set annually via regulation and are based on HMP objectives.

Population Estimation Timeline

Population estimates for deer, elk, and pronghorn are determined annually in March after post-hunt aerial herd composition inventory and harvest surveys have been completed. Because of the statutory requirement to provide population estimates in January, population estimates from the previous year are used in this legislative report.

Herd Management Plans and Objectives

Big game populations in Colorado are managed on the basis of Herd Management Plans (HMPs) for specific herds in defined areas called Data Analysis Units (DAUs) that represent the annual ranges of relatively discrete populations. These DAUs are divided into Game Management Units (GMUs) to better manage harvest and hunter numbers within each herd. Maps showing individual DAU locations and the GMUs they encompass are provided for each big game species (Figs. 4, 6, and 8).

Herd Management Plans establish objectives for post-hunt population size and sex ratios, and are locally developed with public input. Draft plans are presented to the Parks and Wildlife Commission, with opportunities for public comment, revised if necessary, and then approved by the Commission the following meeting. License quotas approved by the Commission each year are used to move populations toward herd management plan objectives using hunter harvest. Population objectives for each herd are expressed as a range of values to provide greater management flexibility and more realistically reflect confidence in the population estimates. Target population objectives are used to indicate the desired population size within the objective range for a given year.

Approximately 92% (115) of the 125 elk, deer, and pronghorn herds have approved management plans. Herds that do not have approved management plans use provisional objectives that are established internally. Many of the herds with provisional objectives have relatively small numbers of animals and/or few conflicts making approval of other HMPs and/or plan updates a higher priority. CPW is continually working on completing new plans, updating existing plans, and seeking approval to implement these plans from the Parks and Wildlife Commission.

In 2018, CPW implemented a stakeholder process to develop the Chronic Wasting Disease (CWD) Response Plan; which was approved by the Commission in January 2018. The CWD Response Plan outlines management strategies for reducing CWD prevalence in some herds and preventing CWD prevalence from increasing in others. CWD has been detected in over 1/2 of Colorado's deer herds and 1/3 of Colorado's elk herds.

5-Year Big Game Hunting Season Structure

CPW uses a 5-year Big Game Season Structure (BGSS) as a framework to guide annual big game hunting regulations, primarily through setting the timing, length, and number of seasons for hunting big game in the state. In November 2019, the Colorado Parks and Wildlife Commission (PWC) approved the Big Game hunting Season Structure (BGSS) for the years 2020 through 2024, after a 16-month long public and stakeholder process. The Big Game Season Structure is intended to guide Colorado Parks and Wildlife (CPW) management activities to keep big game populations at population objective and provide a broad range of hunting experiences to fit the varied preferences of different hunters.

Input on the 2020-2024 BGSS was collected from the public in several different ways. The primary method was through an online public comment form, which was available on the CPW webpage from late December 2018 through early February 2019. A hard copy of the comment form was also available at CPW offices, online as well as at BGSS public meetings. Fifteen BGSS public meetings were held throughout the state during the public comment period. Additionally, there were two telephone town halls (one for residents and one for nonresidents) and two focus group meetings (one on the eastern slope and one on the western slope) where CPW staff engaged with hunters about season structure topics. Through these avenues the agency interacted with 458 in-person public meeting attendees, 6,800 social media public meeting viewers, 4,749 people over teleconference, received public comment feedback from over 3,000 respondents, and spoke extensively with 18 focus group participants.

A major consideration in this process was the efficacy of the 5-year season structure to achieve big game population objectives through harvest management. For example, the four regular rifle seasons were retained and the breaks between seasons were extended to allow animals to redistribute and become more available for harvest on public land during the next season. Late seasons will continue to be used to control big game populations to minimize game damage. The youth allocation of licenses and the opportunities for youth to hunt have been expanded. Expanded youth opportunities offer increased female licenses that will improve our ability to manage to population objectives. At the request of archers, archery season dates were fixed to September 2-30 west of I-25 to allow for better annual consistency and elk hunting during the peak of the elk rut. Unlimited either-sex, antlered, and antlerless archery elk licenses are still available in certain units. New for this 2020-2024 season structure, either-sex and sex-specified archery elk licenses can be limited geographically to meet biological and/or social management objectives. This will allow CPW's to reduce female elk harvest in herds that are below population objective ranges and reduce hunter crowding. Over-the-Counter (OTC) List B archery elk antlerless licenses are only valid in units that also have List B rifle elk antlerless licenses. Pronghorn rifle season was increased from 7 to 9 days; this adds a second weekend that will increase hunting opportunity and harvest. Hunters drawing a bull moose license will now be able to hunt all moose seasons including; archery, muzzleloader, and rifle, with the same license. Finally, changes to the bear seasons and participation rules have been adopted to provide more opportunity for harvest of bears.

B. Summary of Elk, Deer, and Pronghorn Hunters, Harvest, and Population Size

Hunters and Harvest Summary for Elk, Deer, and Pronghorn

Elk hunters and elk harvest peaked in 2004 and then declined for several years. Hunter numbers have since stabilized and slightly increased while harvest has generally continued on a downward trend (Figs. 1 and 2). The overall decline is primarily the result of reductions in limited cow licenses as herds achieve or approach population objectives. Numbers of hunters purchasing over-the-counter (OTC) licenses have been increasing slightly over the past several years following CPW marketing campaigns and as concerns over the economy, fuel prices, fewer elk, and other factors have lessened. CPW's aggressive cow elk harvest over the past years has reduced elk populations in many herds, which has resulted in fewer cow licenses in recent years. For example, large herds such as E-6 (White River), E-14 (Grand Mesa), E-16 (Frying Pan), E-20 (Uncompahgre), E-24 (Disappointment), E-25 (Lake Fork Gunnison R), E-30 (Hermosa), E-32 (Lower Rio Grande) and E-31 (San Juan) are at or approaching objectives and have had considerable reductions in cow licenses (Table 1). It is anticipated that the number of elk hunters and the elk harvest will continue to decline slowly over the next few decades as a result of reduced elk population sizes, an aging hunter population, and lower hunter recruitment. CPW is attempting to increase hunter recruitment and retention through marketing, increased education efforts, improved customer service, online hunt planning, and other strategies.

Recent deer hunter numbers and deer harvest peaked in 1990. Hunter numbers and deer harvest then declined steadily until deer licenses became totally limited in 1999, ending OTC deer licenses. The Wildlife Commission limited deer licenses in response to hunter concerns about population sizes and the number of mature bucks in the herds. Since 1999, deer harvest and deer hunters increased slightly, then declined because of the mortality that occurred in many of the largest deer herds on the west slope during the severe winter of 2007-2008 and the subsequent reductions in limited licenses. Some of those herds have not yet recovered. However, we are encouraged by improved herd performance in many herds. Even though deer populations in central and eastern parts of the state are stable or increasing, many of the largest herds in the western portions of the state have declined and are well below the levels of the late 1980's and early 1990's.

In December 2014, the PWC approved CPW's West Slope Mule Deer Strategy. This two-year effort engaged stakeholders and publics who were concerned about declining mule deer populations and interested in mule deer management. The West Slope Mule Deer Strategy includes seven strategic priorities that are designed to guide management in achieving the goal of working together with the public and stakeholders, to stabilize, sustain and increase mule deer populations in western Colorado and, in turn, increase hunting and wildlife-related recreational opportunities.

Numbers of pronghorn hunters and pronghorn harvests have set records during recent years. This success is due to the fact that pronghorn and pronghorn licenses are abundant in the eastern portion of the state and demand for them is fairly high. This is particularly true of buck licenses. In 2010, pronghorn harvest set a record of 12,300. Harvest then declined for a time as the total pronghorn population was successfully reduced by high female license quotas, additional licenses, and late season hunting. The 2013 season resulted in the lowest success rate (46%) ever observed for pronghorn hunting in Colorado, demonstrating that beyond a license threshold hunter success and harvest actually decline with more licenses. CPW staff, hunters, and landowners in the Southeast Region all expressed concern about the hunter density in many areas. Pronghorn license quotas were designed to move populations towards objectives while addressing these challenges. When the eastern plains receive excellent spring and summer moisture, such as in 2015 and 2016, higher fawn production and recruitment is often the result. Pronghorn populations and license quotas are once again relatively high.

Figure 1. Number of elk, deer, and pronghorn hunters from 1985 to 2019.

Figure 2. Elk, deer, and pronghorn harvest from 1985 to 2019.

Summary of Big Game Population Estimates Compared to Herd Management Plan Objectives

Individual HMP population objective ranges, targets, and 2019 post-hunt population estimates are reported in Tables 1-3. Statewide, the estimated 2019 post-hunt elk population estimate was 292,700 (Figure 3 and Table 1). Thirteen (31%) of the state's 42 elk herds are within their HMP population objective ranges (Table 1).

The statewide deer population estimate was 418,300 (Figure 5 and Table 2). Seventeen (32%) of the state's 54 deer herds are within their population objective ranges (Table 2).

The pronghorn population estimate was 82,200 (Figure 7 and Table 3). Thirteen (45%) of the state's 29 pronghorn herds are within their population objective ranges (Table 3).

C. Elk Herd (DAU) Over Objective

Twenty out of 42 elk herds (48%), exceeded their population objective ranges (Table 1). The sum of the elk population targets from Herd Management Plans for all herds is 276,000 in 2020 (Table 1). In several of Colorado's largest herds, such as E-6 (White River), E-14 (Grand Mesa), E-20 (Uncompahgre), E-24 (Disappointment), E-31 (San Juan), and E-33 (Trinchera), CPW intentionally reduced elk populations toward objectives. Several other large herds, such as E-2, are steadily moving towards objective and are expected to be at or very close to objective with current harvest management strategies. Based on modeled population estimates, statewide elk numbers were reduced from 2004-2013 (Figure 3). As a result, we increasingly hear from hunters, outfitters, and some landowners that there are fewer elk than they would prefer. DAUs E-6 (White River), E-14 (Grand Mesa), E-16 (Frying Pan), E-20 (Uncompahgre), E-24 (Disappointment), E-31 (San Juan), E-32 (Lower Rio Grande), and E-33 (Trinchera) are examples of large herds where hunters have expressed dissatisfaction in the reduced elk population sizes. License revenue also drops because hunting opportunity is reduced. As we reduce elk populations the number of cow licenses necessary to maintain these populations is also reduced.

Figure 3. Estimated statewide post-hunt elk population. Current estimates based on 2019 models.

Approximately 12 elk herds, representing about 30% of the statewide elk population are considered problematic for achieving population objectives. In these herds it is not possible to reduce elk numbers simply by increasing the number of licenses available due to access limitations associated with private land ownership and public land refuges. License increases to the degree necessary to reduce population size can drive more elk onto private property and have the confounding effect of lowering success rates and harvest. There is also a saturation point for limited licenses above which demand drops off sharply and licenses go unsold.

Greater than 90% of limited elk licenses are sold. As CPW reduces license quotas, the number of unsold limited elk licenses has been declining, now only approximately 7%. Because demand is high for limited bull licenses and the majority of rifle bull licenses and archery either-sex licenses are sold OTC, limited license availability, or lack thereof, is related to the number antlerless elk (a.k.a. cow) rifle licenses. Cow licenses are the primary tool for population management. Unsold cow licenses are typically private-land-only (PLO) licenses, in units with access issues, or in hunts with lower success rates.

Examples: [E-3\(North Park\)](#), [E-10\(Yellow creek\)](#), [E-11\(Sand Dunes\)](#), [E-33\(Trinchera\)](#)

Effects of Access on Elk Harvest

Private Land

Lack of private land access is the primary factor preventing elk herds from being reduced to objective in many DAUs. Achieving elk population objectives in DAUs with large amounts of private land can be difficult because harvest in these units is largely determined by the extent landowners will provide access to hunters. Some landowners provide little if any public hunting access whereas others only allow access to bull hunters for a substantial fee. Cow hunters are seldom willing to pay the same access fees as bull hunters so cow harvest on private land can be disproportionately low. Hunting pressure on public land is often much greater than on private land, which can quickly push elk to private land where harvest is greatly reduced. Elk can also occur in more developed areas such as residential subdivisions where hunting can be controversial or prohibited.

Examples: [E-33\(Trinchera\)](#), [E-51\(Castle Rock\)](#)

Even in DAUs with a majority of public land, a high percentage of elk can avoid hunting pressure by congregating on private properties. In some cases, it only takes a few key landowners to restrict hunting to substantially reduce harvest. Elk movement from public to private land is hastened by a high degree of motorized vehicle access on public land.

Examples: [E-55\(Northern San Luis Valley floor\)](#), [E-2\(Bears Ears\)](#), [E-6 \(White River\)](#)

In some DAUs the majority of elk winter on public land. Although late seasons can be effective in these DAUs, holding late seasons is sometimes resisted because they can force large numbers of elk onto adjacent private land where they are more likely to cause agricultural damage.

Examples: [E-20 \(Uncompahgre\)](#), [E-55\(Northern San Luis Valley floor\)](#), [E-5 \(West Elk Mountains\)](#)

Government Refuges

Large refuge areas where hunting is prohibited exist in some DAUs. These areas include National Parks and Monuments, military installations, and county parks and open space. Elk quickly learn where hunting is allowed and where it is not. In some cases such as E-9 (Saint Vrain), deep snow can force elk out of refuge areas where they can be hunted and seasons can be structured to take full advantage of such movements when they occur. In other cases, such as E-11 (Sand Dunes), the refuge area is in winter range and elk can stay protected. CPW works with federal and local governments to try and coordinate harvest efforts as much as possible but the state has no authority to require hunting in these areas.

Examples: [E-9 \(Saint Vrain\)](#), [E-11\(Sand Dunes\)](#), [E-5 \(West Elk Mountains\)](#)

Public Land Access

Even on public land, access can be an issue in some DAUs. Cow harvest can be low in DAUs with large federal wilderness areas or rough, roadless terrain where cow hunters are less likely to go into remote areas where the elk are. In some DAUs, snow will force elk to move into more accessible areas and harvest objectives can be achieved during late seasons. However, in other DAUs elk quickly make the transition from remote wilderness to private land, making harvest problematic during regular and late seasons.

Examples: [E-35\(Cimarron\)](#)

Interstate Movements

Elk in state line DAUs frequently move into Wyoming, Utah, and New Mexico making management of these units uniquely challenging. Coordination with adjacent states and understanding movement patterns are necessary for effective management.

Examples: [E-3\(North Park\)](#), [E-32\(Lower Rio Grande\)](#)

Population Estimates and Population Objectives

CPW has worked diligently over the years to improve our inventory and modeling efforts for big game populations. CPW has investigated the ability to estimate elk abundance, in different habitats, from a helicopter during several projects. These trials are intended to improve the efficiency, accuracy, and precision of our elk inventory. Elk abundance estimates continually prove challenging to obtain with acceptable precision because elk distribution is clumped rather than even on the landscape due to large wintering herds. The big game population models used by CPW continue to evolve as better information and methods become available. For example, research has shown that elk exhibit higher survival and reproduce at older ages than previously thought. These data are now incorporated into population models. The net effect of improved modeling has been an increase in elk population estimates. As a result, some elk herds that were considered to be near objective are now estimated to be above objective. The herd management planning process is also used to better align existing objectives with the newer population estimates when publics are generally satisfied with current population levels.

Strategies to Reduce Elk Populations to Objective

CPW will employ and evaluate a variety of strategies to reduce elk populations to objective. These strategies can be grouped into 6 categories.

1. Liberal regulations that apply to many elk units in the state

- *Over- the- counter (OTC) archery either-sex licenses.*
- *List B cow licenses. List B licenses can be purchased in addition to a primary, List A license allowing a hunter to harvest two elk. CPW designates licenses as List B to incentivize their purchase as an “additional” license when herds are above population objectives and/or the quota typically doesn’t sell out. All private-land-only antlerless license are List B.*
- *List B archery cow licenses in DAUs that have List B rifle cow licenses. .*
- *List C cow and either-sex licenses that allow hunters to harvest an unlimited number of elk. Antlerless private- land-only in certain units and either-sex licenses for plains only units are List C.*
- *OTC rifle bull licenses during 2nd and 3rd seasons.*
- *Youth hunters with unfilled cow or either-sex licenses can hunt cows during all remaining antlerless elk seasons in the DAUs where their original license was valid.*
- *Cow license fees for nonresidents are discounted relative to bull license fees to incentive cow license purchases.*
- *Multiple seasons.* Holding 4 rifle seasons with breaks in-between allows time for elk to redistribute during the break periods. Each season brings in a new wave of hunters and success rates are consistently highest at the beginning of each season. The 2020-2024 Big Game Season Structure retained these 4 rifle seasons and increased the length of the breaks between them to encourage movement off private land refuges to increase harvest.

2. Regulations commonly used to increase antlerless elk harvest.

- *Increased rifle cow licenses during the regular seasons.* The most straightforward way to increase cow harvest is to increase the number of cow licenses during the regular seasons. Although this approach can be very effective in some DAUs, it can have little benefit or prove detrimental to harvest in others, particularly when hunter access is the primary issue limiting harvest. Offering too many licenses can result in unsold licenses, hunter crowding, reduced success rates, and more hunters that are dissatisfied.
- *Change limited bull licenses to either-sex licenses.* Replacing limited bull licenses with either-sex licenses has proven to be an effective way to increase cow harvest in some DAUs because experience has shown that cows make up approximately 35% of the harvest on either-sex licenses.

- *List B or List C regular and private land only (PLO) cow licenses.* A hunter can purchase a List B license in addition to a List A license (e.g., most bull and either-sex licenses are List A licenses) or another List B license. Hunters can purchase any number of List C licenses. Cow licenses in DAUs that are over objective are List B to encourage harvest. All PLO cow licenses statewide are List B or List C.
- *Extended PLO cow seasons.* Keeping pressure on elk on private land even when regular hunting seasons are closed can be an effective way to keep more elk on public land and increase harvest. Extended PLO seasons can run from August 15th until the end of February and do not need to conform to regular season dates. Hunting cow elk is generally not allowed outside of this period because of concerns about dependent young and late gestation.
- *Late cow elk seasons.* Late cow seasons that occur between the end of the 4th regular rifle season and the end of February can be very useful for achieving harvest objectives in many DAUs. Use of non-PLO late seasons must weigh the potential for increased harvest against the potential for pushing more elk to private land.

3. Regulations used to reduce agricultural damage and conflicts

- *Special Game Damage Seasons and Habitat Partnership Program (HPP) Distribution Hunts for cow elk.* Special Game Damage Seasons are widely used to address elk damage issues on specific private properties. Game damage licenses for private land are approved by the local Area Wildlife Manager and are limited in number by CPW regulation. When game damage is occurring at larger scales, a distribution management plan may be developed. HPP distribution hunts are used to redistribute elk to address elk damage on multiple properties and can include public land.
- *Kill permits for bulls and cows.* In some cases, CPW has issued kill permits to allow sharpshooters to kill elk outside of seasons and/or after legal hours. Kill permits are used to address special game damage situations where regular hunters would be ineffective.
- *Summer bull seasons.* This strategy has been used in E-55 to keep pressure on elk damaging irrigated croplands during the summer.

4. Landowner incentive programs

- *Ranching for Wildlife (RFW).* The RFW program offers transferable bull licenses to enrolled landowners with large properties (>12,000 acres) in return for allowing some public hunting. Most public licenses are for cow hunting. RFW provides valuable opportunity for increasing cow harvest on large properties where little opportunity would otherwise exist. RFW has been very successful at increasing cow harvest in many DAUs with large private ranches (for example E-2 (Bears Ears)).
- *Landowner Preference Program.* SB13-188 enacted changes to the existing Landowner preference program in three main areas: information collection, enforcement, and program changes. The new program was implemented in July 2014 and was applied to the limited license draw for the first year in the 2015/2016 hunting season. Colorado's wildlife depends on private land for habitat. Even in a state with 23 million acres of public land, some of the most valuable wildlife habitat in the state is on private land. Many of Colorado's hunters, resident and non-resident alike hunt on private land. As an incentive, the Landowner Preference Program dedicates an allocation of limited licenses to qualified landowners. In general, landowners who see wildlife as a benefit accept larger populations of wildlife on their farms and ranches and are more willing to improve habitat for wildlife.
- *Private land hunt coordinators.* In some cases, the CPW via the Habitat Partnership Program (HPP) has provided hunt coordinators to schedule hunts and accompany hunters on private property. Hunt coordinators help minimize landowner-hunter interaction and provide increased assurance that rules specified by landowners are obeyed. Although this program can be expensive, it can be useful in certain situations such as in E-11 (Sand Dunes).

5. Regulations occasionally used.

- *Limited archery hunting.* Studies with radio-collared elk in some DAUs have shown substantial movements of elk from public to private land during the early archery and muzzleloader seasons. OTC archery either-sex licenses are available in most DAUs, and OTC List B archery cow license are available in some DAUs, but archery harvest usually makes up only a small portion of the overall cow harvest. Rifle hunters are much more efficient at harvesting cows than archery hunters. Whereas the number of rifle elk hunters has steadily declined, the number of archery elk hunters has steadily increased. Limiting archery hunting pressure can potentially result in more elk being available to rifle hunters on public land and thereby increase cow harvest. However, limited archery hunting is strongly opposed by many archery hunters including the Colorado Bowhunters Association.
In 2010, Gunnison (DAU E-43) archery licenses were limited in an attempt to keep elk on public land to achieve population objectives. In 2020, all archery elk licenses were limited in E-24 (Disappointment), E-30 (Hermosa), and E-31 (San Juan).
- *Open state wildlife areas (SWAs) to late season hunting.* Some SWAs are closed to late season hunting to help keep elk off of private land. Allowing hunting on these SWAs can increase harvest but it can also push elk to private land where they are more likely to cause damage. The efficacy of opening SWAs to late season hunting often depends on sufficient counter hunting pressure on surrounding private lands.
- *OTC rifle cow licenses.* OTC rifle cow licenses have been issued in some DAUs in the past. In many DAUs that are over objective, leftover cow licenses are often easy to obtain (indicating an excessive supply); in this situation, OTC licenses (which are unlimited) would be of little value for increasing harvest.
- *Totally limited elk licenses.* Proponents of totally limited elk licenses often claim that harvest can be increased by making all elk licenses limited and reducing the number of hunters. CPW has found little evidence to support this claim. Although most limited elk DAUs on the east slope are at or close to objective, these DAUs have relatively small numbers of elk and do not have a history of exceeding objectives. No public nominations for totally limited elk hunting (all hunts and seasons) were made during the 2015-2019 or 2020-2024 Big Game Season Structure processes. Historic attempts to create more totally limited elk units have been met with considerable and often times overwhelming opposition from the public.

6. Potential new strategies

CPW considers new management strategies or ideas through the BGSS, annual regulatory process, and public petition process. Several previously considered or attempted ideas for reducing elk numbers are listed below. Some of these options have received consideration by the PWC and CPW in the past but were not implemented for a variety of reasons. Some of the options would be strongly opposed by certain segments of the public even though they might be effective at reducing elk numbers. Other options are presented because they are commonly suggested by the public.

- *Access Programs.* In 2017, CPW created a pilot big game access component within the existing Walk-In Access Program. Walk-in access for big game could increase harvest in DAUs that are above population objective. This option will provide deer, pronghorn, and elk hunting access to private land enrolled in the highly successful small game Walk-In Access program (i.e., landowners are paid a per acre fee by CPW to allow public hunters on their property).
- *Early rifle cow seasons.* In DAUs where elk make early movements to private land, early rifle cow seasons could potentially increase harvest. Early rifle seasons are opposed by many archers and muzzleloader hunters.
- *Culling.* Culling involves using agency personnel or contractors to shoot elk to reduce the population. Culling is occasionally used by the National Park Service to reduce elk numbers because sport harvest is prohibited in most national parks and monuments. CPW has done some elk culling to address concerns related to chronic wasting disease. Culling is seldom acceptable to the public unless there is a clear need and there is no other option. The need is usually either that habitat degradation due to overpopulation

is obvious (such as the recent culling operation in Rocky Mountain National Park) or reducing animal numbers could alleviate a major threat to animal or human welfare. Culling hundreds of elk to get a DAU down to objective would be strongly opposed by the public and is not considered realistic by CPW.

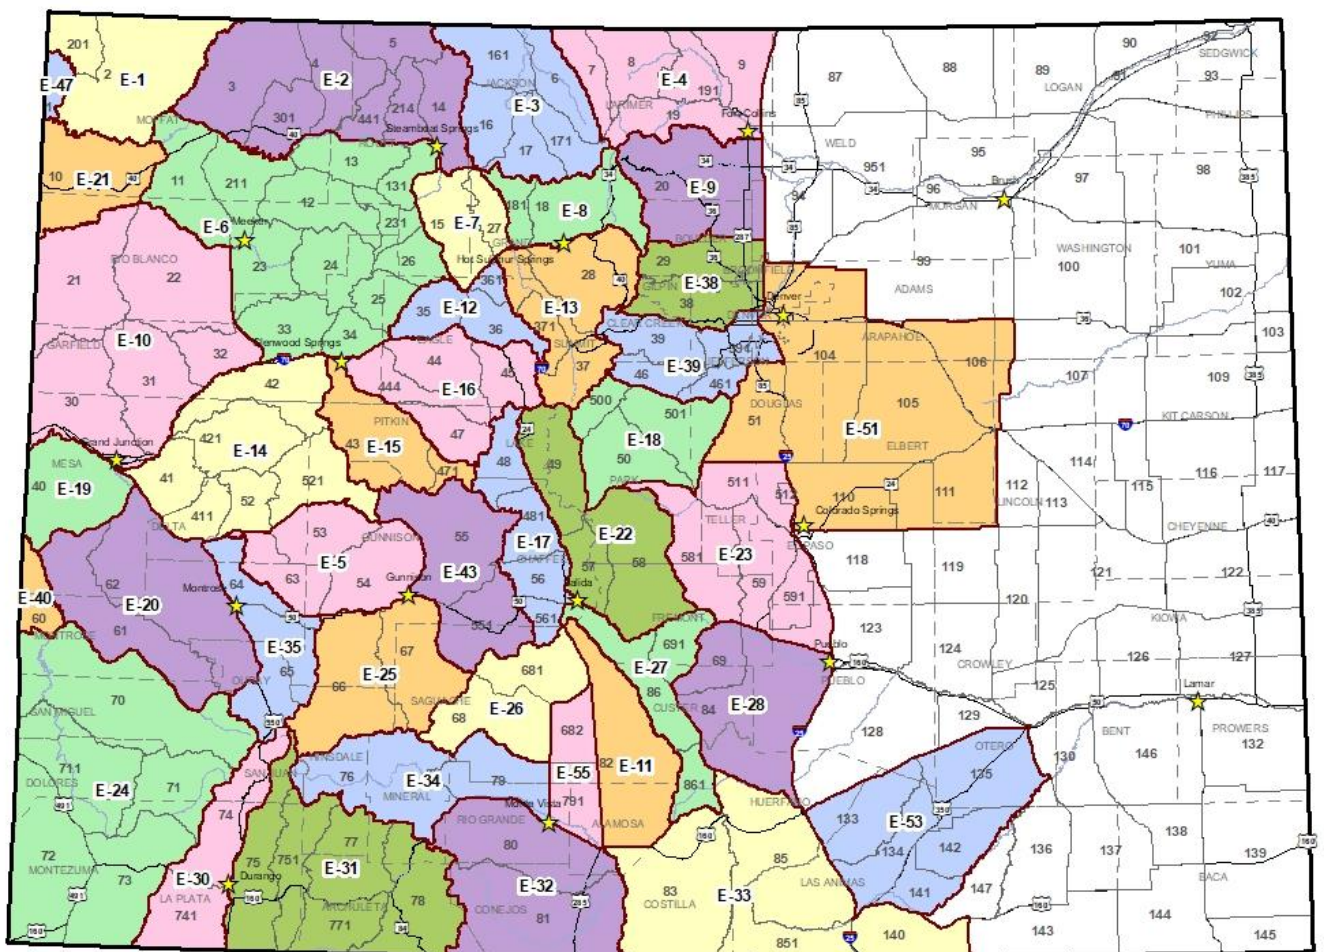

- *Translocation.* Capturing and moving elk from high density units to low density units or out of state is commonly suggested by the public. On a DAU scale, translocation would be cost prohibitive and would be a short-term solution at best. Furthermore, by Commission policy, CPW cannot move elk from CWD positive units to areas where the disease has not been detected. CWD has been detected in approximately 1/3 of Colorado elk herds . Most of the northern part of the state is positive for CWD and CWD has not been detected in much of southern Colorado. Additionally, there is little if any demand for Colorado elk from other states, particularly given concerns regarding CWD.

D. Elk Herds (DAU) Below Objective

Nine out of 42 elk herds (21%) were below population objective ranges (Table 1).

Strategies to Increase Elk Populations to Objective

- *Decrease limited antlerless and either-sex license numbers.* Many of Colorado's elk herds are very productive, particularly in the northern tier of the state. Typically, when elk populations are lower than they historically have been, it is a direct result of liberal cow licenses designed to reduce herd size to meet population objectives. The southern tier of the state has had lower, and declining, calf ratios for over a decade so antlerless licenses have been reduced even more dramatically there when herds are below population objective. Examples: [E-30 \(Hermosa\)](#), [E-31 \(San Juan\)](#), and [E-34 \(Upper Rio Grande\)](#).
- *Research low elk recruitment.* In 2017, CPW initiated a new research project to investigate causes of low calf ratios in the southern tier of the state.
- *Limit cow and either-sex archery licenses.* The 2020-2024 BGSS provides the opportunity to limit archery hunting by DAU.
- *Reduce wildlife-vehicle collisions with highway crossing structures for wildlife.*

4 Pt = 4 point antler restriction on bulls
Spike = No antler point restriction on bulls
P Spike = Some GMUs in the DAU are 4 Pt and some are Spike
Lim = All elk licenses are limited in the DAU
OTC = Over the counter licenses
Mix = Some GMUs in the DAU are Lim and some are OTC.

E. Deer Herds (DAUs) Over Objective

Seventeen out of 54 deer herds (32%) exceeded their population objective ranges (Table 2). Several of these herds are on the eastern plains of Colorado, which consist almost entirely of private land.

Strategies to Reduce Deer Populations to Objective

- *Increase PLO and regular doe licenses.*
- *List B regular season doe licenses.*
- *White-tailed deer only doe licenses.*
- *PLO season-choice doe licenses.*
- *Landowner Preference Program*
- *Late doe seasons.*
- *SE Region GMUs west of I-25 have over-the-counter, either-sex white-tailed deer only licenses to increase hunting opportunity and reduce white-tailed deer populations. These licenses were initiated in 2014.*
- *Access Programs.* In 2017, CPW created a pilot big game access component within the existing Walk-In Access Program. Walk-in access for big game could increase harvest in DAUs that are above population objective. This option will provide deer, pronghorn, and elk hunting access to private land enrolled in the highly successful small game Walk-In Access program (i.e., landowners are paid a per acre fee by the CPW to allow public hunters on their property).

F. Deer Herds (DAUs) Below Objective

The sum of the deer population targets from Herd Management Plans for all herds is 493,500 in 2020 (Table 2). Although several herds have increased in recent years and others are steadily moving toward objective, 20 of 54 herds (37%) are still below objective range. Many of the large herds in western Colorado have declined resulting in the statewide total deer population decline (Figure 5).

Figure 5. Estimated, statewide post-hunt deer population. Current estimates based on 2019 models.

Population Estimates and Population Objectives

Severe winters negatively affect mule deer herd performance by lowering survival. High deer mortality occurred in most of the West Slope during the 2007-2008 winter and populations in a few of those DAUs have not fully recovered. Portions of northwest Colorado also experienced difficult winters in 2010-2011 and 2015-2016. The Gunnison Basin and herds north of Craig to the Wyoming line experienced an extremely severe winter in 2016-2017.

Strategies to Increase Deer Populations to Objective

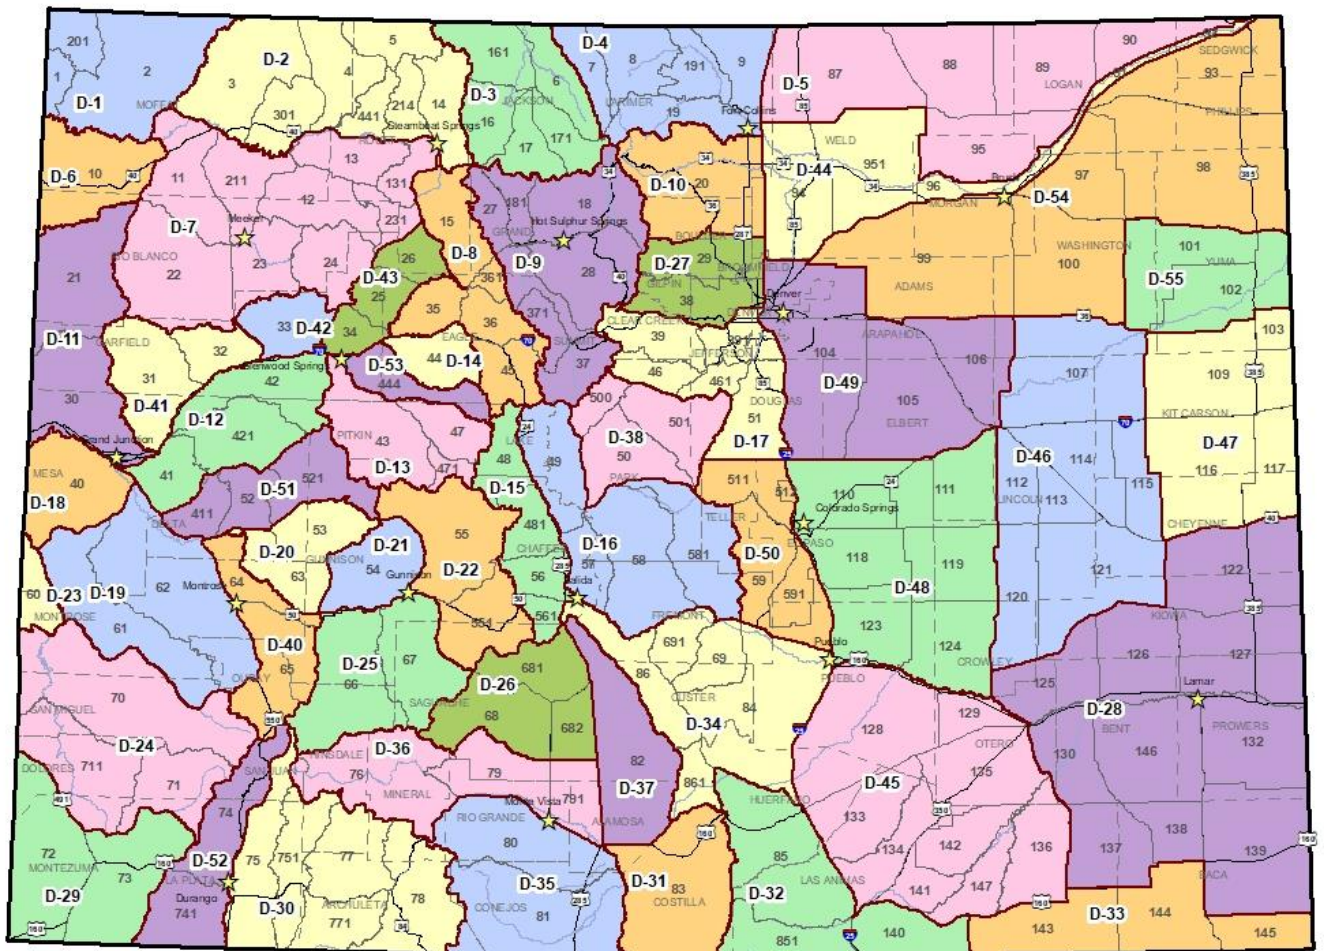

- *Reduce or eliminate regular season doe licenses*
- *Modify hunt codes to remove list "B" and list "C" designations to allow more than one deer in the annual bag limit.*
- *Reduce PLO doe licenses to the extent practicable to still address game damage concerns.*
- *Landowner Preference Program*
- *Habitat improvement projects.*
- *Reduce wildlife-vehicle collisions with highway crossing structures for wildlife. On the Western Slope, more adult mule deer does are killed by vehicle collision than hunters. Annually 2% of does CPW radio-collars are killed by vehicles.*
- *Reduce elk numbers to objective to reduce inter-specific competition on shared winter range.*
- *Research: In December 2016, the Colorado Parks and Wildlife Commission approved two predator management plans that will guide research projects in the Piceance Basin and in the Upper Arkansas River to research the influence of predator removal on mule deer survival.*

DAUs WITH URBAN DEER CONFLICTS

Strategy to Reduce Urban Deer Conflicts

Year-round, non-migratory deer densities have increased in many communities. This is often independent of the population trend for the herd. CPW is attempting to minimize urban deer conflicts with early seasons that are set prior to the arrival of migratory deer. The first of such seasons started in 2011 around the communities of Craig and Buena Vista. These efforts were expanded to include the Salida area in 2012.

In 2017, CPW created a new program to use special seasons and licenses to hunt urban and suburban deer and elk within participating cities, towns, or municipalities using Director-approved species management plans.

G. Pronghorn Herds (DAUs) Over Objective

Eight out of 29 pronghorn herds (28%) exceeded their population objective ranges (Table 3). The sum of the pronghorn population targets from Herd Management Plans for all herds is 74,200 in 2020 (Table 3 and Figure 7).

Effects of Access on Harvest

Most pronghorn in Colorado occur on private land. Harvest is often dependent on landowners providing hunting access, which historically has not been a major issue in most DAUs. Some landowners have requested relatively short pronghorn seasons, particularly late seasons, to minimize the amount of time hunters are on, or requesting permission to hunt on their property. An increasing number of landowners are charging hunters for access to hunt pronghorn. If pronghorn hunting continues to become more of a commercial asset for landowners, similar to deer and elk hunting, it may become increasingly difficult to achieve harvest objectives because buck hunters are willing to pay higher fees than doe hunters.

Population Estimates and Population Objectives

In 2008, CPW implemented an improved method for estimating pronghorn numbers on the eastern plains. This method, known as distance sampling, provides a sample-based population estimate that can be incorporated into population models. The net effect of this change has been an increase in estimated pronghorn numbers particularly in the southeastern part of the state. As a result of the higher numbers, CPW undertook measures to aggressively increase pronghorn harvest from 2009 to 2013 by issuing more doe licenses, making doe licenses List B, creating late doe seasons, and allowing youth hunters with unfilled licenses to continue hunting during late seasons. As license numbers have increased, hunters and landowners have become less satisfied with the hunting seasons and experience. Additionally, some doe licenses never sell in these areas.

Figure 7. Estimated, statewide post-hunt pronghorn population. Current estimates based on 2019 models.

Strategies to Reduce Pronghorn Populations to Objective

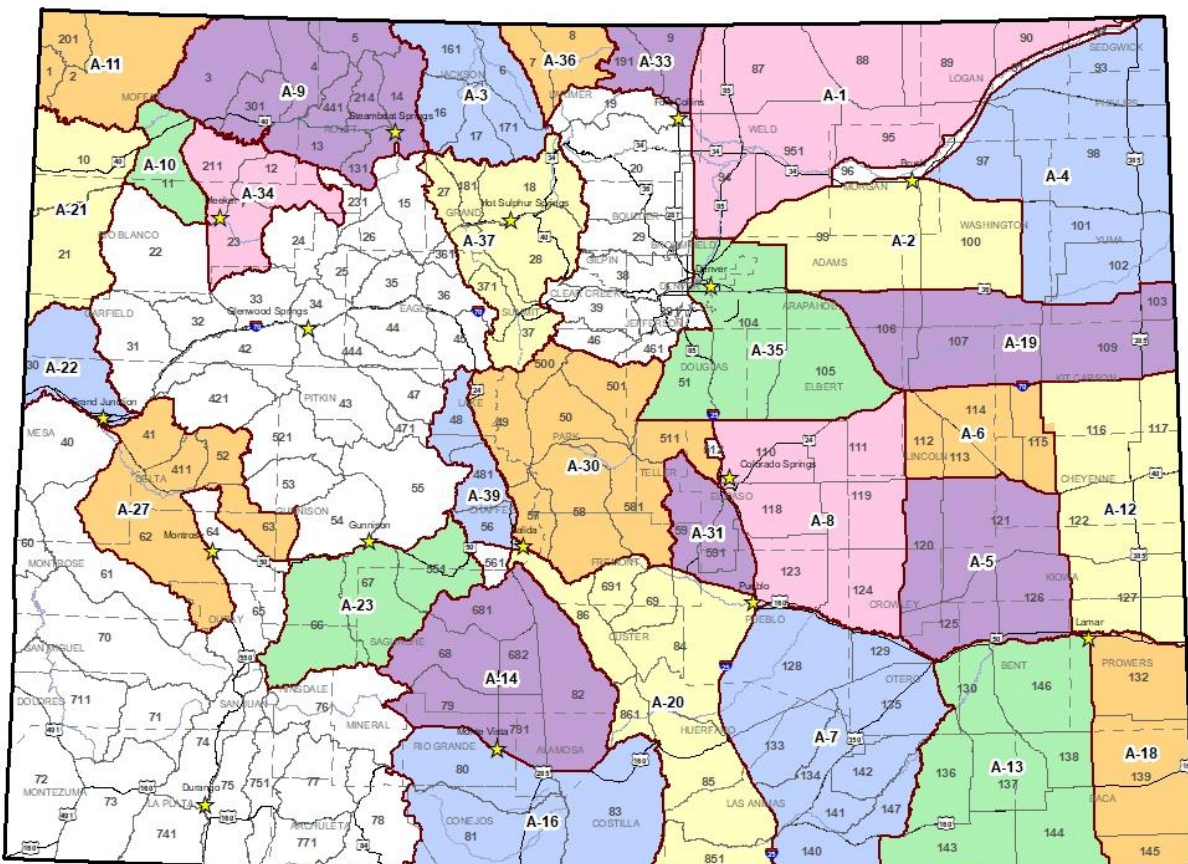

- *Increased doe licenses during regular seasons.*
- *Classify regular doe licenses as List B so hunters can obtain two.*
- *Youth hunters with unfilled doe or either-sex pronghorn licenses can hunt does during some late pronghorn seasons.*
- *Create late doe seasons. Late doe seasons were added in pronghorn DAUs A-5 (Haswell), A-6 (Hugo), A-7 (Thatcher), and A-8 (Yoder) in 2010. In 2011, CPW lengthened those seasons and added a late season in A-12 (Cheyenne) and A-18 (Two Buttes). In 2019, CPW lengthened the late doe season in PH-33 (Cherokee). Where appropriate, most pronghorn herds that are above objective currently have late doe seasons.*
- *In 2020, CPW extended the late doe hunt in PH-33 (Cherokee) until January 31st, as allowed by the new BGSS.*
- *Combine several GMUs into a single hunt code to increase the area a license is valid.*
- *Separate buck and doe seasons to allow for more doe licenses without impacting hunt quality for buck hunters; this was initiated in DAU A-10 (Maybell) in 2011 and A-37 (Middle Park) in 2018.*
- *Landowner Preference Program.*
- *Access Programs. In 2017, CPW created a pilot big game access component within the existing Walk-In Access Program. Walk-in access for big game could increase harvest in DAUs that are above population objective. This option will provide deer, pronghorn, and elk hunting access to private land enrolled in the highly successful small game Walk-In Access program (i.e., landowners are paid a per acre fee by the CPW to allow public hunters on their property).*

H. Pronghorn Herds (DAUs) Below Objective

Eight out of 29 pronghorn herds (28%) were below their population objective ranges (Table 3). Most of these herds are on the western slope and have been impacted by several years of drought and severe winters. A-21 (Dinosaur) and A-27 (Delta) have small pronghorn populations that have shown long, steady declines that cannot be reversed by harvest management alone. In 2012, A-27 was closed to hunting until the population of pronghorn increases to the point that it can be sustainably hunted. The provisional population objective for A-11 (Sand Wash) is now considered unrealistically high and will be adjusted lower until the population demonstrates a significant increase.

Strategies to Increase Pronghorn Populations to Objective

- *Reduce or eliminate regular doe licenses.*
- *Reduce PLO doe licenses to the extent practicable to still address game damage concerns.*
- *Close units to hunting.*
- *Reduce wildlife-vehicle collisions with highway crossing structures for wildlife.*
- *Translocation.* Capture pronghorn in areas over objective and relocate them in areas such as the Gunnison Basin where populations have been greatly reduced by unusually high winter mortality. Three transplants into the Gunnison basin were completed in 2010, 2011, and 2012. A transplant of pronghorn to augment the A-27 (Delta) population occurred in 2012.
