GROUND WATER LEVELS IN THE NORTHERN HIGH PLAINS DESIGNATED BASIN 2014

This report contains the basic ground water level data collected from wells in the Northern High Plains Designated Ground Water Basin during the winter of 2013-2014. Data were collected in cooperation with the Marks Butte, Frenchman, Sand Hills, Central Yuma, W-Y, Arikaree, Plains and East Cheyenne Ground Water Management Districts, and local well owners. This data collection effort is part of a statewide ground-water-level monitoring program funded by Senate Bill 200 (1987 legislative session). That legislation authorized the Office of the State Engineer to establish and maintain a water-level monitoring network throughout the state to obtain information on ground water conditions, to evaluate ground water trends and to manage the ground water resources of the state.

During the winter of 2013-2014, a total of 684 wells were measured. Wells which have gone dry, are inaccessible, have been plugged, or are otherwise unusable, are removed from the network and replaced where feasible. The wells in this report are listed first by the management district in which they lie or county, if outside of a management district, then by township, range and section, beginning in the north and proceeding south. Tabular data are presented for each well for the previous ten years. Graphical data show the entire period of record for each well. Analyses of changes in the water level in the aquifer are based on single point comparisons and may be complicated by unknown pumping schedules or other site-specific hydrologic factors.

The report also contains data from wells, which are part of this monitoring effort, but for which measurements were not available in 2014. The map on the following page shows the location of these wells as well as those that were measured in 2014. Wells lacking measurements for the past 10 years have been removed from the monitoring program and are no longer included in this publication, though the data are retained in the Division of Water Resources HydroBase database. To provide a broader perspective of long-term water level trends we have also recorded the initial static water level, if reported, when the well was constructed.

Table 1 summarizes some of the statistics gleaned from the data and is organized by management district or county. This information includes the range of water levels recorded and the average change in water levels of all wells in the district on a one, five, and ten year interval. It should be remembered that this value is an average change in water level over all of the wells within the district, which may not be truly representative of the district as a whole. On average, the water levels were relatively similar to 2013, with a difference of one foot or less. Water levels in the W-Y Management District increased approximately 2 feet the past year, while in Prowers County; they decreased over three feet on average. The long-term 10-year water level comparisons show a declining trend that ranges from approximately -2 to -10 feet, with the exception of Kiowa County where average water levels have actually increased for that time period.

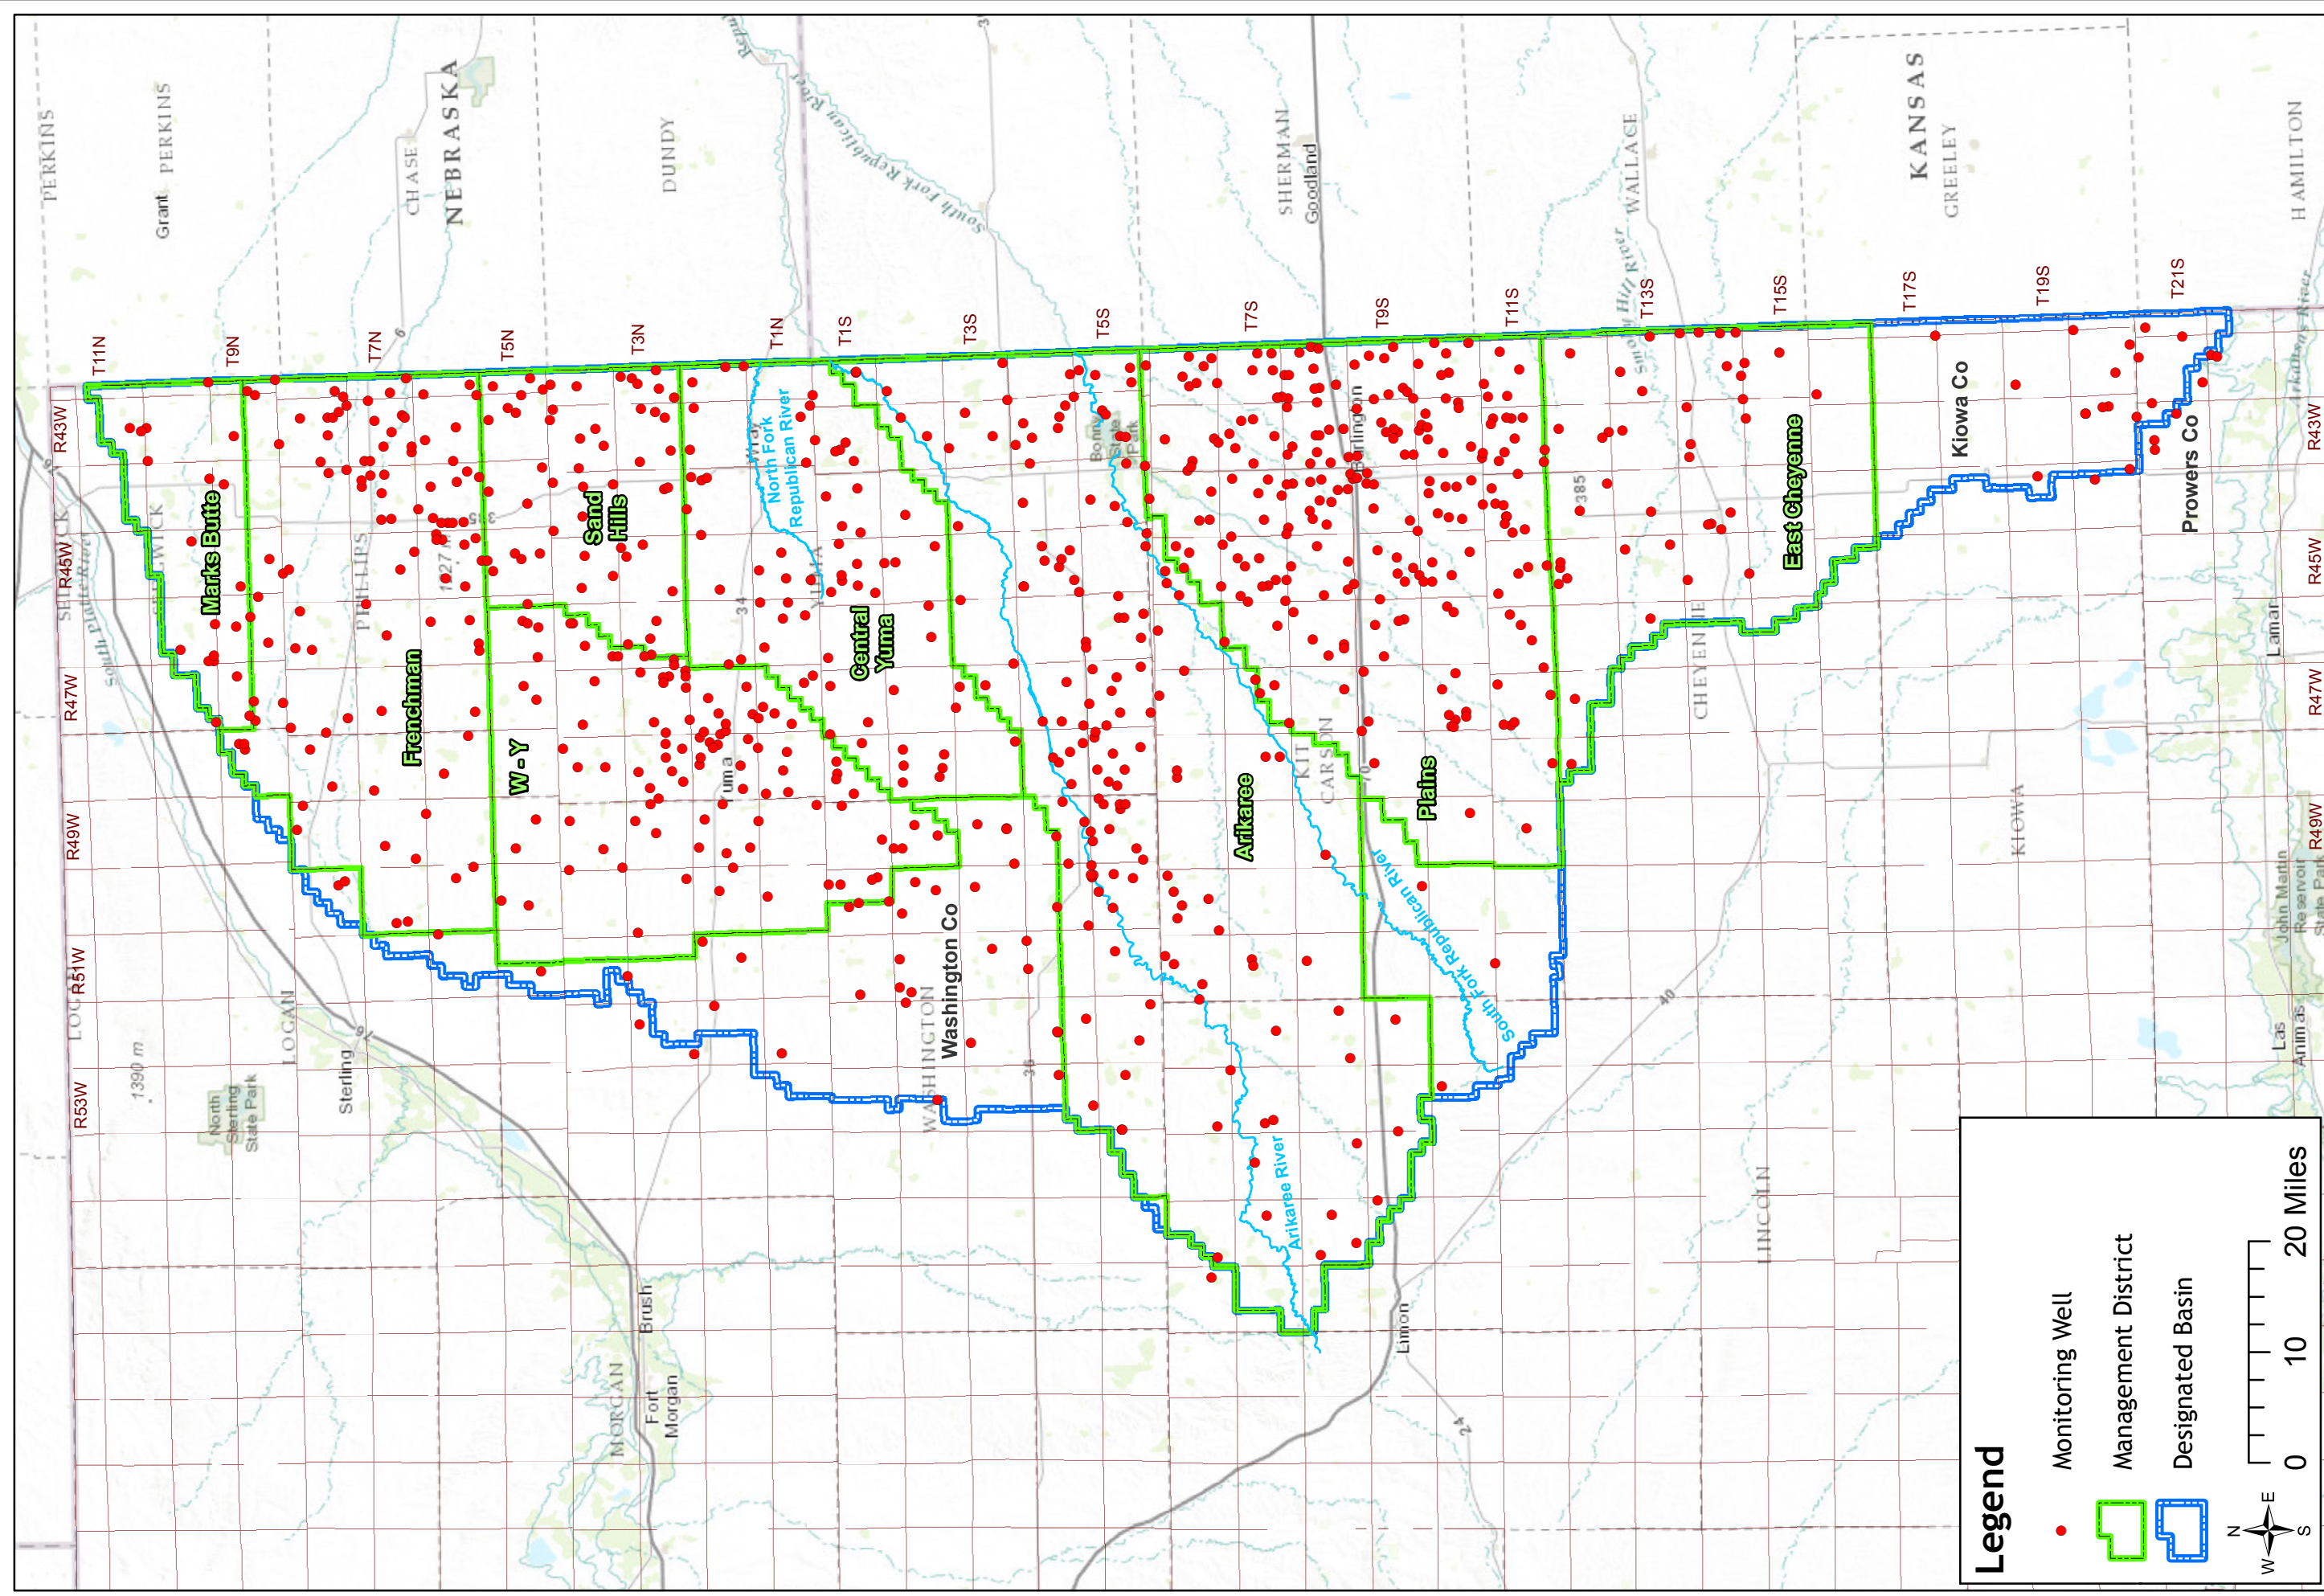

For the second consecutive year, we have included color-coded maps showing the change in water levels for a one (2013-2014), five (2009-2014), and ten (2004-2014) year period. This year the maps include all wells within the monitoring program with data for the selected time period. The changes, both positive and negative are displayed by color in accordance with the map key.

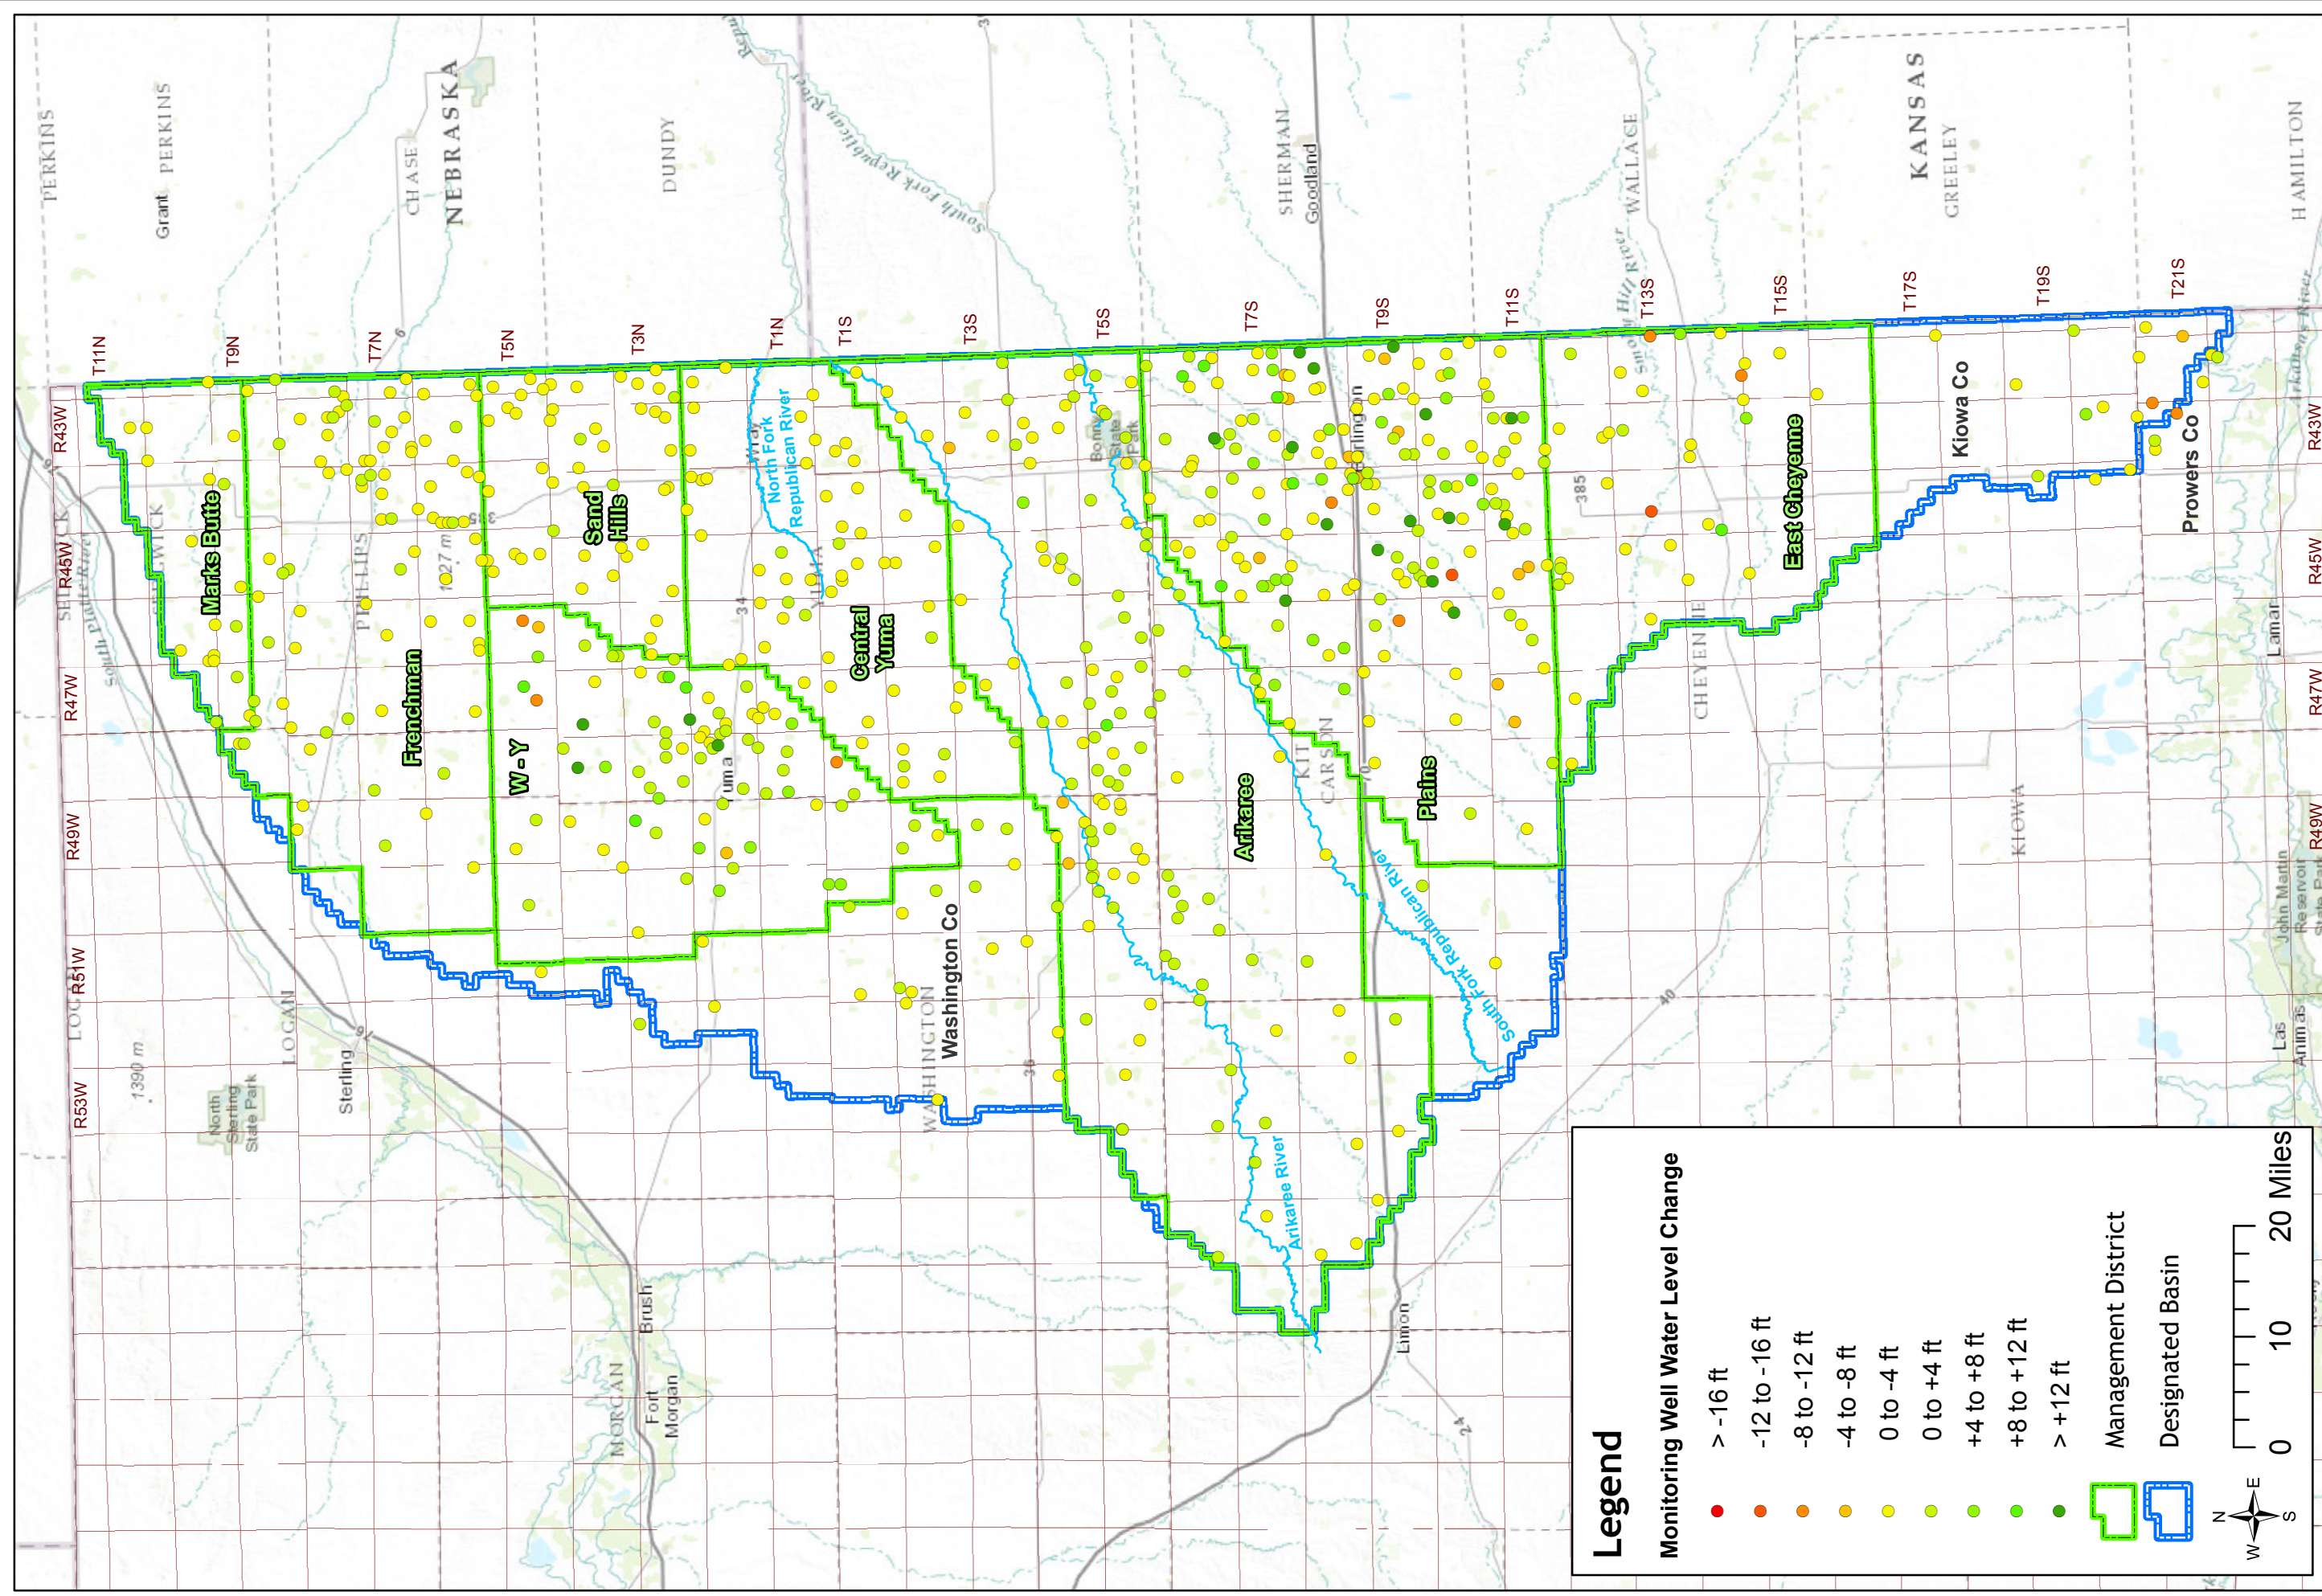

Copies of this report can be purchased from the Office of the State Engineer, Records Section, 1313 Sherman St., Room 821, Denver, CO 80203, (303) 866-3581. Additionally, digital versions of this report, in Adobe PDF format, may be viewed or downloaded from the Division's website, <http://water.state.co.us/groundwater/Pages/HydroGeo.aspx>. The data may be accessed on the internet at the Colorado Decision Support System website <http://cdss.state.co.us> and can be exported to in number of different formats.
