WATER LEVELS IN THE ALLUVIAL AQUIFERS OF THE
LOWER SOUTH PLATTE RIVER BASIN, COLORADO

2002

The purpose of this report is to provide water level data for the network of monitoring wells within the Lower South Platte Alluvium for the period of Spring of 1988 through the Spring of 2002. Currently, the network consists of 79 wells. The data presented in this report is a result of cooperation between well owners, the Central Colorado Water Conservancy District, and the Colorado Division of Water Resources. Funding for this project is supplied in part from well permit fees collected and managed by the Colorado Division of Water Resources as a result of the passage of Senate Bill 200 during the 1987 legislative session.

The following body of this report includes up to 28 water level measurements for each well for the indicated period in addition to a water level measurement taken at the time of construction of the well, if available. Measurements are usually taken twice yearly, typically in the spring before irrigation pumping commences and in the fall after irrigation pumping has ceased. The measurement values in this report are expressed in feet below ground surface to water surface and were obtained utilizing an electric sounder device or steel tape. All measurements were done by Division 1 Water Commissioners (DWR) or the Central Colorado Water Conservancy District (CCWC) as indicated for each well. All of the wells are completed in unconsolidated gravel, sand, silt and clay deposits predominantly of alluvial origin. The line in the main body of this report entitled AQUIFER delineates both the geologic unit and stream reach for each well as explained on page 4. Figure 1 is a GIS generated map showing the recorded location of the wells measured for this report. The South Platte River system is delineated. The recorded outline of the South Platte River alluvial aquifers is depicted in gold.

The observation wells can be subdivided into two types: those which lie within or very near the South Platte River floodplain, and those located in tributary valleys. The number of observation wells in tributary valleys exceeds the number along the South Platte floodplain by 17.

An evaluation of the data of beginning water levels as compared to Spring 2002 levels reveals that approximately 59.5% of the wells have experienced a water level decline which compares to a 58.2% decline in the 2001 report and 37.7% with declines in the 2000 report. By contrast, 6.3% of the wells experienced a rise in the Spring 2002 as compared to the Spring 1988 water level. This percentage represents a third year of reduced number of rises including 10.1% in 2001 and 15.9% in 2000. Declines of Spring 1988 to Spring 2002 range from -0.18' to -11.81' as compared to the range of -0.08' to -8.05' in the 2001 report. Declines on the order of 0.01' are insignificant in that such changes can be caused by wind, earth movement, and the effect of evapotranspiration and phreatic consumption or maybe errors in data recording. The table following this narrative entitled "Table of Water Level Trends of the South Platte Alluvium through Spring 2002" recaps the statistics to date for this ongoing report in terms of all wells within the tributary valleys and the South Platte main stem/floodplain.

These data also reveal that the averages of the water level changes from Spring 1988 to Spring 2002 wells within the tributary valleys (both rises and declines) are more than the averages of the South Platte floodplain alluvium. By comparison, in 2001-2002 the average rise and declines of Spring 1988 vis-a-vis Spring 2001 changes in the tributary valleys were, for the first time in three years, more than those in the South Platte floodplain.

The average annual water level change for the period of record for this report is averaging -0.24 ft/yr in the South Platte floodplains which is twice the annual rate computed last year. The tributary valleys experienced a nearly twenty-fold increase in average annual decline at 0.80'/year. Concurrently, the annual rise of the South Platte floodplain was less in 2002 than 2001. Overall, the tributary valley rises were non-existent.

The reader is advised that these data are based upon the measurements of only 79 wells. This represents less than 3 percent of the total nonexempt wells along the South Platte system between Kassler and the Colorado-Nebraska state line. No areal weighting of data has been done.

WATER LEVELS IN THE LOWER SOUTH PLATTE NETWORK

Explanation

Geologic Units

All of the monitoring wells in this report are completed in unconsolidated gravel, sand silt, and clay of predominantly alluvial origin. The following subdivision is based upon location of the wells with respect to modern stream channels, floodplains, terraces, and interstream divides.

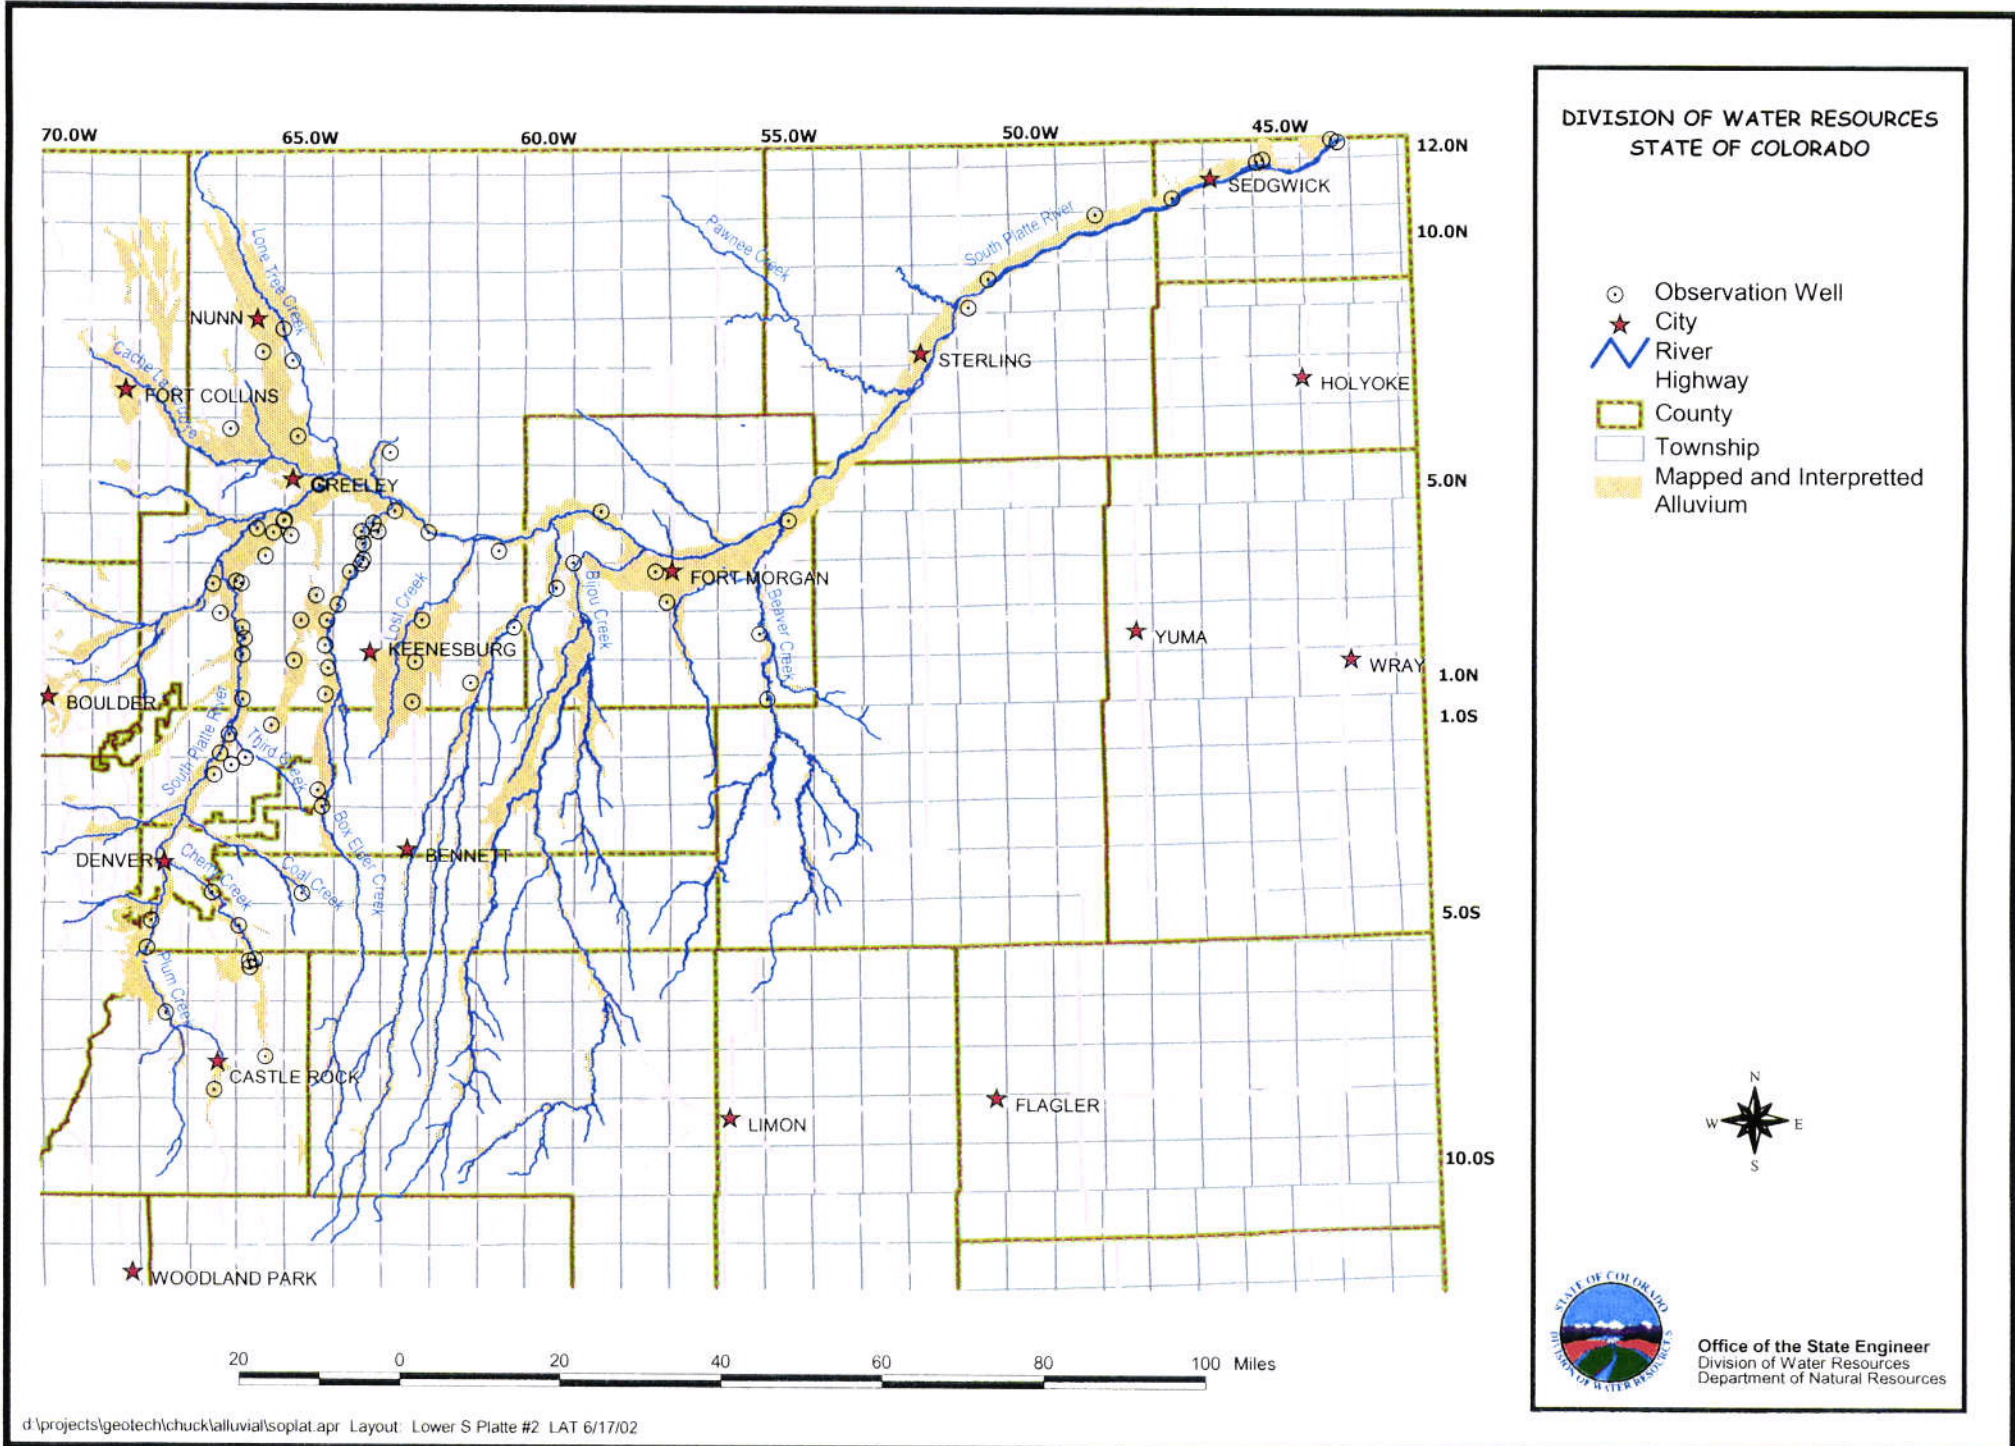

- Qal - Recent stream alluvium and floodplain deposits.
- Qoav - Alluvium of areas not within a distinct floodplain; upland areas along interstream divides; includes deposits of eolian origin.
- Qt - Alluvium underlying terraces identified and mapped by other investigators.

Stream Reach

Each of the monitoring wells included in this report has a code following the Geologic Unit indicating the stream reach or tributary reach of the well (e.g. Qal/BIA).

<u>Code</u>	<u>Reach of Stream</u>
SPA	Mainstem of South Platte from Greeley downstream
USP	Upper South Platte: Platte Canyon to Greeley
PCA	Plum Creek drainage
CCA	Coal Creek drainage
CLP	Cache La Poudre drainage
BVA	Beaver Creek drainage
BIA	Bijou Creek drainage
LCA	Lost Creek drainage
BEC	Box Elder Creek drainage
LTC	Lone Tree Creek drainage
TCA	Third Creek drainage
CHC	Cherry Creek drainage
