State Engineer

DIVISION OF WATER RESOURCES

DEPARTMENT OF NATURAL RESOURCES
W. G. WILKINSON P.E.
IRRIGATION DIVISION ENGINEER
ROOM 208 8th AND 8th OFFICE BLDG.
GREELEY, COLORADO 80631
OFFICE: 352-8712 HOME: 484-3917

March 22, 1971

Mr. C. J. Kuiper
State Engineer of Colorado
101 Columbine Building
1845 Sherman Street
Denver, Colorado 80203

Dear Mr. Kuiper:

The Annual Report of the Division Engineer for Irrigation Division No. 1 of the State of Colorado for the 1970 water year is herewith submitted.

Included within this report is the Annual Report of Dean E. Thompson on the distribution of water through the east slope facilities of the Colorado-Big Thompson Project.

The courtesy and assistance extended to me by you, your staff and the personnel of Division No. 1 over the past year has been greatly appreciated.

Respectfully submitted,

W. G. Wilkinson
Division Engineer

1970 ANNUAL REPORT

I. INTRODUCTORY STATEMENT

Division I covers an area of some 28,068 square miles or approximately the northeast one-fourth of the State of Colorado. Of this, approximately 19,500 square miles is in the South Platte River Basin, 8,165 square miles in the Republican River Basin, and 403 square miles in the Laramie River Basin.

SOUTH PLATTE RIVER

The South Platte River starts at the Continental Divide, flows through South Park, down mountain canyons, out onto the plains in the Denver area, thence northeasterly and into Nebraska near the northeast corner of Colorado. The flow of the South Platte is augmented by a number of tributaries in the South Park area, the principal ones being the Middle and North Forks of the South Platte and Tarryall Creek. After leaving the mountains, the South Platte is principally augmented by several major tributaries arising at and east of the Continental Divide and flowing to the South Platte from the north and west. These major tributaries entering the South Platte in the Denver area are Bear, Clear, Boulder and St. Vrain Creeks, and the Big Thompson and Cache La Poudre Rivers. Only normally minor and intermittent streams supplement the river flow from the south and east. However some of these, such as Plum, Cherry, Boxelder, Kiowa, Bijou, Badger, Beaver, as well as Lone Tree, Coal, Wild Cat and Pawnee Creeks from the north and west are each capable of producing a major flood due to the extent and topography of their individual watersheds when subjected to intense precipitation.

In addition to the obvious tributary streams, the South Platte River is further supplemented very extensively as are the tributaries themselves by what is commonly referred to as return flow. This is water from springs, waste ditches, drains, seepage, etc., resulting generally from diversions for various uses, precipitation, and high water tables. These additional sources enter the streams in relatively small amounts at extremely numerous locations along the entire reaches of the streams.

The water supply is further supplemented by a number of diversions from transmountain sources. The water from these transmountain sources is controlled and used by specific ownership entities and as such the first use of it is not subject to appropriation as a part of the waters of the South Platte Basin. These transmountain diversions are treated in more detail later in this report.

The elevations in the South Platte Basin vary from 14,000 feet at points along the Continental Divide to 3,400 feet at the Colorado-Nebraska line. The western one-third of the basin is mountainous in character and provides the principal source of water as the result of precipitation.

Of the 12,481,000 acres in the South Platte Basin, 8,694,000 acres are in farms and ranches. The balance of the area is owned by federal and state governments, public agencies, or included within municipalities. Within the farm areas are 852,000 irrigated acres and 7,842,000 acres of dry land according to the 1964 Agricultural Census.

The precipitation pattern for the year was rather unusual with the water supply being tremendously affected by the storms of October 1969 when 40% of the total precipitation for October '69 to October '70 period occurred, resulting in 122% of normal precipitation for that year. The balance of the year as a whole was very nearly normal although January, February, and April were unusually dry while March, June, and September were far wetter than average. The April through September period produced 57% of the moisture for the twelve months indicated. This amount was 95% of normal although with wide variations for short periods.

Although precipitation was nearly normal for the summer, no serious shortages were experienced due to the ample soil moisture conditions and the good stream flows resulting from the October and March storms.

The principal use of water in the mountain valleys is for meadow irrigation. Large volumes of water are released on meadows adjacent to the streams and of this volume a major proportion returns to the stream for reuse at lower elevations. The largest area of mountain valley irrigation is in South Park at elevations up to 11,000 feet. Other uses in the mountain areas include those of small municipalities, domestic, stock, power, mining, commercial and recreation.

The greatest use of water, by far, in the South Platte Basin is for agricultural purposes in the plains area at elevations between 3,500 and 5,000 feet. The water here supports a well developed, diversified agricultural economy that ranks high nationally in productivity. Much of the demand for water in areas downstream some 40-50 miles from the mountains is supplied by return flow from uses further upstream and from wells.

In the past 20 years a tremendous population increase has occurred in the area near the mountains and out as far as Greeley. Greatest growth is centered around Denver and its suburbs, followed by Boulder, Fort Collins, Greeley and the presently smaller municipalities. Consequently, the demand and use of water for municipal supplies is increasing rapidly with the burden being met from transmountain sources and transfers from agricultural uses.

The population forecasts by municipal, federal, and state agencies indicate the front range area will suffer a greatly accelerated population growth in the years ahead.

The following tabulation of present and projected population figures for some of the front range counties indicate the nature of some of our water supply problems both now and in the future:

POPULATION PROJECTIONS BASED ON 1970 CENSUS

<u>COUNTY</u>	<u>1970</u>	<u>1990</u>	<u>INCREASE</u>	<u>2020</u>	<u>INCREASE</u>
Adams	185,100	315,000	170%	480,000	259%
Arapahoe	160,291	340,000	222	505,000	315
Boulder	130,002	240,000	185	455,000	350
Denver	512,691	580,000	113	710,000	139
Douglas	8,315	25,000	302	100,000	1,202
Jefferson	252,232	415,000	164	650,000	257
Larimer	88,664	175,000	197	325,000	367
Weld	89,086	175,000	196	325,000	365
Totals	1,426,381	2,265,000	159	3,550,000	248

This growth is occasioned by the influx of industry, agreeable climate, scenic beauty and the general prosperity of the area. Much of the industry coming in or originating here is of the, so called, sophisticated type which although attracting people does not tend, in itself, to degrade the environment to the degree experienced in some eastern states.

As the requirements for water to supply the needs of municipal, industrial and commercial uses increase, it is apparent that some change in water use will be necessary. The competition for water creates a market and the above mentioned uses, realizing a higher unit return from their water consumption are looking to agricultural water for their supply. Some of this change of use occurs as a normal function of urban growth when formerly irrigated agricultural lands are developed and annexed to municipalities which require the water rights theretofore used on the land to be transferred to the municipal water system.

At the present time the cities of Boulder, Estes Park, Fort Collins, Greeley, Longmont and Loveland are forming a subdistrict of the Northern Colorado Water Conservancy District for the express purpose of developing additional west slope water and importing it to the South Platte Basin for their use through the facilities of the Colorado Big Thompson Project.

Mutual and private irrigation interests are constantly endeavoring to upgrade their systems by expansion of their facilities or making better use of water supplies.

The greatest development and expansion of use in the South Platte Basin during the past 25 years has been that of underground water. Not only have wells been used to supplement surface water supplies but also many have been drilled to irrigate what had previously been range land. Through the use of sprinkling systems this formerly dry, rough land has become highly productive.

Considerable controversy exists at the present time as to the effects of underground pumping upon surface supplies and the administrative methods necessary for the effective control of pumping. Although laws have been passed presuming to remedy this problem, many questions of

interpretation and implementation of such laws are yet unanswered. Final interpretation by the courts of both present and future laws will determine the measure of administration to be applied for underground water.

Many small water projects have been constructed, mostly of a private nature. The greatest activity numerically after wells has been in the construction of livestock water tanks. Although these are each small in capacity, they provide a type of water conservation and a small measure of local flood protection.

In Water District No. 3 the North Poudre Irrigation Company completed the construction of Park Creek Reservoir in early spring with a capacity of 7,320 acre feet. This reservoir was financed through federal sources with a small projects loan and will be used principally as an exchange and regulating reservoir. However, it was filled this season from excess river water.

Plans for enlargement of Long Draw Reservoir near Poudre Pass have been completed and construction awaits approval and funding from the Small Projects Section of the Bureau of Reclamation. The reservoir is owned by Water Supply and Storage Company and will be principally supplied by trans-mountain water from the Grand River Ditch. The capacity will be increased 6,600 acre feet by the enlargement.

The outlet replacement on Larimer and Weld Reservoir was also completed last spring after being delayed by inclement weather in the fall of 1969.

In Water District No. 4 the repairs on the outlet and dike of Boyd Lake were completed by early spring and the reservoir was in full service for the irrigation season.

Construction on Chatfield Dam has resumed this fall with the awarding of additional contracts for the outlet works and embankment. Chatfield is a flood control dam on the South Platte River upstream from Denver and below the mouth of Plum Creek and is being built by the Corps of Engineers.

The Corps has made a study and prepared a feasibility report on flood control structures in the Bijou Creek Drainage. The plan presently includes four potential dam and reservoir sites with a combined floodwater storage capacity of 252,000 acre feet to be developed at a cost of \$50,000,000. The Corps contends the project is feasible and the residents of the affected area appear to favor the proposal. Further studies and considerable local pressure will be necessary before final approval and funding are forthcoming.

On the main stem of the South Platte, two reservoir claims have been filed and adjudicated by the courts. The Narrows Reservoir as proposed by the Bureau of Reclamation has been awarded an appropriation date of 8-2-57 with a conditional priority for 718,147 acre feet. The Weld County Reservoir was awarded a conditional priority for 230,900 acre feet as of July 2, 1963.

The Narrows site is about 25 miles downstream from the Weld County site and both reservoirs would depend upon the same water for supply. The Weld County Reservoir is proposed by a group of mutual ditch and irrigation

companies in Water District No. 1, with financing by private capital, whereas the Narrows is backed by the Lower South Platte Water Conservancy District working with the Bureau of Reclamation. The strongest support for the Narrows comes from Water District No. 64.

The feasibility of two reservoirs is quite questionable so it becomes a matter of settling differences between the two proponents and unifying the effort for the construction of one reservoir. There are distinct advantages for either site, so the final selection will probably hinge on the priority of available construction funding.

REPUBLICAN RIVER

The Republican River Basin in Eastern Colorado covers 5,226,000 acres. Of this area 4,690,000 acres are in farm and ranch land with 86,000 acres under irrigation and 4,604,000 acres of dry land as reported in the 1964 Agricultural Census.

This area is relatively dry and the surface streams, many of which are intermittent, provide only enough water for some lands adjacent thereto. The normal precipitation in this area is about 17.1 inches of which 13.6 inches or 80% falls during the April through September period. This year, October '69 through October '70, the precipitation was 77% of normal. Excluding October of '69 only 60% of normal precipitation was experienced with all months falling below normal.

During the past twenty years many wells have been drilled with a substantial proportion of the agricultural production attributable to irrigation from pumping. The greatest impact of groundwater development has been in the Burlington area where there is a thriving agricultural economy based mainly on irrigated row crops. The water in this area is being mined from the Ogallala Formation at the rate of 40% depletion in twenty-five years. The prospect of recharging this aquifer is in considerable doubt at this time. Consequently, it is unlikely that this high plains area will experience any major industrial or population change such as that in areas closer to the mountains.

LARAMIE RIVER

The Laramie River Basin in North Central Colorado contains 258,000 acres of which 4,800 acres are irrigated and 15,000 acres are nonirrigated ranch land according to the 1964 Agricultural Census.

This basin is a mountain valley with the principal water use being for meadow irrigation and livestock purposes. There are no municipalities or villages in this basin so the domestic uses are minimal.

Under a Supreme Court decree the water in the Laramie Basin is allocated volumetrically. The irrigated acreage of each ranch has been determined and 6.0887 day second feet per acre allotted for the season of which only .3715 day second feet may be used after July 31. Further, the above mentioned decree provides for transbasin diversions of up to 19,875 acre feet annually.

The past season started out with a heavy snowpack followed by adequate precipitation and stream flows all summer. The demand for water was such that the diversion allocations were not used to their full extent although the water was available.

The Laramie River Basin is becoming increasingly popular as a recreation area, particularly as related to fishing. Some changes of ownership to recreation interests have occurred and more are anticipated although the water use is expected to remain quite stable. The changes in ownership appear to be more concerned with control of fishing rights and public access now than in the past. No significant changes in the water use pattern are expected in the next few years.

II.

PERSONNEL

Several changes in personnel have occurred during the water year.

Fortunately, all of the water commissioners in the division were with us for the full season. However, some changes were necessary in the ranks of the deputy water commissioners. In Water District No. 3, Ron Thaemert resigned in August to devote his full time to academic activity at C.S.U. He was replaced in October by A. R. Lowery.

In Water District No. 4, Deputy Water Commissioner Ted Bell was promoted in June to a hydrographic position as Water Resources Engineer I attached to the Greeley Office. No eligible deputies to replace him were available in that area so it was necessary for him to also help out on the administration of District 4 until the end of the water season. Marion Stephenson has been appointed to start work next spring as deputy in that area.

The boundaries of Water District No. 8 were expanded to include that area of former Water District No. 23 drained by the South Platte River below Cheesman Reservoir inlet, including the North Fork of the South Platte. A deputy, Frank Norman, was appointed in June to help administer this enlarged district.

The deputy water commissioner in District 48, Hartzel Black, resigned the last of July and no one has yet been appointed to replace him.

Three new permanent positions have been filled in the Division Office in Greeley.

Jim Clark was appointed as Deputy Division Engineer in April and has proved to be a most able and willing assistant.

Ted Bell, as previously noted, was appointed as a hydrographer and is now capably and officially doing the work he has helped with during the winter months for several years as well as the new duties assigned to him.

Darshan Walia, a Water Resources Engineer I, was assigned to this office in July as a hydrographer after receiving some training at the State Office in Denver. Dar has had considerable experience in water administration in India in a capacity comparable to that of a Division Engineer in Colorado.

George Sievers, a student at C.S.U., was also assigned to this office as a trainee hydrographer during the summer months. It is hoped that he will return next summer.

All of the division personnel have performed their duties conscientiously and capably. Most everyone's work load has been substantially increased by tabulation requirements and expanded responsibilities.

A. SNOWPACK

The April 1st snowpack and soil moisture report is considered to be the key to the water supply for the season by farmers and soil conservation personnel. Their planning is based, to a large extent, on this report. The May 1st report is thought of as an adjustment to the April 1st information.

On April 1st it was reported that the South Platte and its tributaries would flow much above normal, based on normal precipitation for the remainder of the season. The soil moisture was good in the entire area and carry-over storage in the many reservoirs was 131% of normal.

Temperature averages for the month of April were considerably below normal through the area drained by the South Platte and its tributaries. This held true for the entire State, with near record lows being recorded at most mountain and western stations.

As a result of the cold weather in April, following a period of predominately cold temperatures since the first of the year, we had unusually heavy mountain snowpack for so late in the season.

The snowpack on the South Platte and its tributaries was near the maximum of record on May 1, 1970, with some snow courses above previous maximums.

SUMMARY OF SNOW MEASUREMENTS

WATERSHED	NO. OF COURSES AVERAGED	This Year's Snow Water as Percentage of	
		LAST YEAR	AVERAGE*
Big Thompson	5	221	156
Boulder	3	296	172
Cache La Poudre	8	205	165
Clear Creek	5	248	157

A. (Continued)

WEATHER MODIFICATION

The Bureau of Reclamation is doing most of the present work on weather modification, including their contract agreements with a number of universities and other organizations. This is being carried out under the Bureau's Office of Atmospheric Water Resources in a program entitled, "Project Skywater."

There are a very wide range of projects being carried out under this program, including:

- Investigation of Possible Atmospheric Side Effect.
- Precipitation and Streamflow Evaluations.
- Legal, Social and Natural Environment Considerations.
- Hydrologic and Economic Investigation of Precipitation Management.
- Operational Adaptation.

The most interesting of these projects to us is the final one. Operational Adaptation is the phase of the program where the theory is put to work to produce much needed water.

Two seeding programs in the Upper Colorado River Basin, one supported by the State of Colorado, show evidence of significant snowfall increases averaging about 10-15 percent. Preliminary studies suggest that a 15 percent snow increase in the high mountains of the Upper Colorado River Basin would make available 1.8 million acre-feet of new water annually. Production costs are estimated at \$1.00 to \$1.50 per acre-foot in a fully operational program.

In talking with Dr. Cannon of the National Center for Atmospheric Research (NCAR) in Boulder, we discovered that the technology for treating warm clouds has not been developed. This type of cloud is encountered in the summer months, in areas where increased precipitation would be beneficial.

The most immediate benefit will come by utilizing the cold cloud treatment technology, thereby increasing the snowpack and potential runoff. The benefits could be quite significant, as indicated by the Upper Colorado River Basin Studies.

III.

B. PRECIPITATION

The precipitation during the summer months, coupled with the abnormally high spring runoff and reservoir supplies was generally quite adequate to meet irrigation requirements in the South Platte Basin. In fact, most irrigators, when assured of adequate water supplies, prefer minimum precipitation during the summer, thereby allowing them to schedule and control the application of water to their crops to their best advantage and at the same time experiencing reduced risk to their crops from damage by hailstorms or untimely rains.

April and May of 1970 were both deficient in rainfall as compared to normal over most of the irrigated area. Many farmers found it necessary to irrigate to germinate the seed after planting. This practice has become more prevalent in recent years especially where well water is available at times when ditches are not running or are insufficiently supplied.

June and July brought above normal rainfall in most of the South Platte Basin. Since most streams and ditches had adequate surface supplies, much of the precipitation in this period was of limited value to the irrigators. Fortunately, although the precipitation was above normal no severe storms of great extent were experienced except for the hailstorm near Julesburg.

Precipitation in August again fell below normal. This circumstance, accompanied by warm temperatures and adequate water supplies, allowed for good growth, full maturing and satisfactory harvest conditions during that month.

September precipitation was considerably above normal causing some temporary adverse conditions in the ensilage, potato, late bean harvest and subsequently the first part of the beet harvest in October.

The precipitation for the summer months in the Republican River Basin was below normal with no severe storms of consequence.

No precipitation records are available for the Laramie River area. However, the local ranches considered precipitation to be above normal. This condition is further supported by the fact that surface water use on the Laramie meadows was considerably below the allowable quota.

B. HAIL SUPPRESSION

In the United States, the area with the highest frequency of hail is centered roughly around the point where the states of Colorado, Nebraska and Wyoming join. The region extending northward from this area into South Dakota and southward into Kansas is sometimes referred to as "Hail Alley."

Atmospheric scientists from Colorado State University (CSU) in Fort Collins have studied hailstorms in Northeast Colorado for several years, near the center of this area.

In 1968, CSU, the National Center for Atmospheric Research (NCAR) located in Boulder, and the ESSA Atmospheric Physics and Chemistry Laboratory of the ESSA Research Laboratories in Boulder, joined forces in a cooperative effort aimed at learning more about hailstorms. This program is known as the Joint Hail Research Project.

The principal field research area used by the scientists of the project is a circle about 60 miles in diameter, centered on an NCAR radar installation at New Raymer, Colorado. One of the most important contributions to the success of the project is made by people who live in the area. They help verify radar reports of hail and pinpoint the location of hailstorms.

Field operations will begin in the summer of 1971 for the project. The goal of the project is "to make a definitive contribution to the question of the operational and economic feasibility of hail suppression."

III.

C. FLOODS

The potential for considerable flood damage existed on May 1st in the South Platte Drainage Basin. Due to a happy combination of alternating high and low temperatures, crops were kept growing well and snowmelt runoff was retarded sufficiently to avoid excessive damage.

The most severe flooding in this drainage area occurred in South park late in April. This was caused by Chinook winds in the area, which lasted for several days. This flooding resulted in considerable damage to highways and bridges in the Hartsel and Tarryall areas. Many ditch structures throughout South Park were washed out also.

Eleven-Mile and Cheesman Reservoirs were both spilling by May 1st as a result of the South Park runoff. A peak spill of approximately 4800 CFS was observed on April 28th at Cheesman Dam. The peak spill at Eleven-Mile of 2144 CFS occurred on April 29th. Considerable damage was done to dirt roads below both dams. The dike between Lake George and the channel carrying the South Platte past the lake was breached by the high flows. The Lake George Spillway handled the entire flow of the river, which was then passing directly through the lake, sustaining some damage to the spillway but with only moderate damage to the main Lake George Dam.

In the meantime, the high flow of Michigan and Tarryall Creeks above Tarryall Reservoir caused concern about the Tarryall Dam, with water actually running over the top of the dam at one time. The high volume of water below the reservoir destroyed several bridges and sections of the road to the point where it joins the South Platte.

This high runoff in South Park resulted in some minor flooding in the Littleton area, with some channel erosion and minor flooding and road damage from Denver to the State Line.

Temperatures remained below average through June and July, which helped distribute the runoff over a longer period and further reduced flood danger.

Temperatures in August were above normal, bringing the corn and sugar beets along in very good shape.

Flooding of tributaries along the Front Range was kept at a minimum in part by the foresight and the efficient water management of our water commissioners. Considerable reservoir capacity was maintained to skim the high flows from the streams. During the month of May, water was delivered directly from reservoirs on demand in Water District 3. This can be done when the potential runoff is sufficient to fill the reservoirs later, but can be very risky if the potential does not materialize.

The most damaging storm of the season occurred on May 28th Southwest of Julesburg, with hail cutting a swath about six miles wide and extending north into Nebraska.

III.

D. GENERAL

A water budget is herewith submitted for the 1970 irrigation year. Due to the number of variables involved and the unavailability of complete and accurate data the figures herein shown are, in many instances, estimates or approximations at best. Figures are omitted if there is no reasonable basis for making an estimate.

ANNUAL REPORT
 COLORADO-BIG THOMPSON PROJECT
 1970

Water Districts in Division I, within the Northern Colorado Water Conservancy District, started the irrigation season with excellent carry-over storage and good soil moisture conditions to supplement the expected streamflow.

Forecasts in March, April and May indicated above average run-off, with high water expected in South Platte drainage.

STREAM FLOWS

OPERATION "SKIM"

The period of Big Thompson "Skim" extended from April 26 to April 30 and May 4 to October 26, 1970.

<u>Apr</u>	<u>May</u>	<u>June</u>	<u>July</u>	<u>Aug</u>	<u>Sept</u>	<u>Oct</u>	<u>Total cfs</u>	<u>Total a.f.</u>
31.	7,473.	14,438.	8,953.	1,767.4	827.	421.	33,910.4	67,261.

Computations are based on measured sum of Big Thompson River at Estes, Fish Creek and Wind River to system minus Big Thompson River near Estes.

Surplus water during no demand period is computed on sum of Big Thompson 'Skim' and Dille Tunnel minus return to river at Mouth of Canyon through Bureau Power Plant and 15' Parshall flume to river. This water is used or stored through Big T system.

<u>Nov.</u>	<u>Dec.</u>	<u>May</u>	<u>June</u>	<u>July</u>	<u>Total a.f.</u>
968.	1,359.	153.	5,302.	286.	8,068.

RIVER OPERATION

Conditions were favorable this past irrigation season to hold a predetermined, steady flow out of Lake Estes and deliver the difference of the total measured inflow to the river at the mouth of canyon, less surplus stored. Additional power revenue was realized by holding the river to fish requirements. Tributaries to the river between Estes and mouth of canyon do not fluctuate from day to day to change the pattern appreciably. Irrigation companies set their headgates each morning and were assured of a steady flow determined by previous day computations. Extended hot weather required adjustments. The commissioner's cooperation with the bureau and record of inflow, outflow figures for delayed delivery made for more efficient use of water, ease of operation, and general satisfaction by the water users.

PRECIPITATION

Big Thompson S. C. S.	14.43 inches
Estes Park Station	15.52 inches
Waterdale	17.99 inches

A total of 191 stream measurements and 52 canal or ditch measurements were made by Thompson during the water year.

Mr. Darshan Walia was employed to assist the hydrographic section and was assigned to the Greeley office July 15, 1970. Mr. Ted Bell, formerly a deputy water commissioner in District 4, joined the Greeley hydrographic section.

Respectfully submitted,

Dean E. Thompson

Dean E. Thompson
Water Resources Engineer

IV

A. AGRICULTURE

As previously stated in the introductory remarks, agriculture in the mountainous areas of this division is almost wholly oriented to the raising of livestock and roughage. This feed is grass for grazing in the summer, largely on nonirrigated land, and hay produced on irrigated meadows for winter use. Very little grain or row crops are produced in the mountains. The good moisture conditions for 1970 resulted in an abundance of grass and hay even in instances where irrigation facilities were severely damaged by the excessive runoff and stream flows of late April. In fact, some ranchers encountered problems in trying to get their meadows dried-up sufficiently for the hay harvest.

Agriculture in those irrigated areas east of the mountains is quite similar on all the various tributary streams of the South Platte River. Very good crops resulted from a generally adequate water supply all season.

No statistics on crop production for the 1970 season are available at this time. As a general indication of the crops raised and the acreages harvested however, the following tabulations are included for the 1968 crop year. These figures are taken from Bulletin 1-70, published by the Colorado Department of Agriculture in June of 1970 and entitled:

COLORADO
AGRICULTURE STATISTICS
1969 PRELIMINARY
1968 FINAL

V.

COMPACT AND COURT STIPULATIONS

A. The South Platte River Compact, Colorado and Nebraska being the signatory states, specifies that the flow of the river at the state line between April 15 and October 15 of each year shall be at least 120 cfs. Otherwise, diversions below the Washington, Morgan County line, junior to June 14, 1897, will be curtailed sufficiently to provide said 120 cfs or such portion thereof as might be produced by suspending all surface diversions in that section of the river.

The flow did fall below 120 cfs this year for a period of about seven weeks (1st of August to middle of September). The most junior ditch diverting during this period in the Compact Control Area was the Peterson, with an appropriation date of March 1, 1895.

The Republican River Compact allocates water to the signatory states, Colorado, Kansas, and Nebraska, on the basis of beneficial consumptive use. Colorado's total allocation of 54,100 acre-feet is broken down as follows:

North Fork of the Republican River Drainage Basin, 10,000 acre-feet;
Arikaree River Drainage Basin, 15,400 acre-feet;
South Fork of the Republican River Drainage Basin, 25,000 acre-feet;
Beaver Creek Drainage Basin, 3,300 acre-feet; and
In addition, for beneficial consumptive use in Colorado, annually,
the entire water supply of the Frenchman Creek (River)
Drainage Basin in Colorado and of the Red Willow Creek
Drainage Basin in Colorado.

The 1970 water year figures for the Republican aren't available at this time, however, no difficulties have been encountered to date.

The Laramie River Agreement with Wyoming presented no difficulties this year. The decree of the United States Supreme Court, in the case of Wyoming vs Colorado, limits Colorado appropriations to 39,750 acre feet of water per calendar year in the aggregate. By agreement among Colorado users, this allocation has been divided into 19,875 acre feet to the Transmountain users and 19,875 to the Meadowland users.

In 1970 the Meadowland users diverted a total of 11,347 acre feet. The Transmountain users diverted a total of 16,714 acre feet.

VI

A. DAMS

Most reservoirs in the division had water available for filling to capacity. With so much water available a few structural problems have become apparent.

Standley Reservoir has caused the greatest concern. This reservoir is north of Arvada on Big Dry Creek and fills principally from Clear Creek through the Croke Ditch and Farmers Highline Canal. The capacity at spillway is 50,222 acre feet. Due to incomplete spillway facilities, the reservoir has never been allowed to fill above a gage height of 92 feet which is 10 feet below spill elevation. When the reservoir level approached this elevation, signs of distress appeared on the crest of the dam. Since 1967, stop orders have been issued holding the fill limits between gage heights of 88.0 and 91.0 feet and observing the affect upon the embankment. Longitudinal cracks on the crest have developed and expand when the water is above the 89.0 ft. depth. For this reason the present stop order of 89.0 feet will be in effect until circumstances warrant further filling.

On March 23 an order was issued to lower the water level of Main Reservoir in Water District 7 to a point 11.5 feet below spillway until the spillway was repaired.

Marie Reservoir in Water District No. 7 failed in the spring when a section of the embankment gave way. This is a small reservoir and very little damage was done. The repairs to the embankment were made before plans were submitted for approval. No further trouble has yet developed.

Lake George, a small recreation reservoir beside the South Platte River in Water District No. 23 suffered some damage during the high water in the last week in April. The river overflowed the dike next to the reservoir and caused considerable erosion of the spillway. Fortunately, the main embankment for the reservoir held although excessive leakage occurred at the same time.

Included herewith is a list of dams and reservoirs as furnished by the dam section of the state engineer's office. Not all reservoirs are included on this list. An effort will be made to update and correct the list when possible.

VI

B. LIVESTOCK WATER TANKS

A tabulation of 7934 livestock water tanks with a total capacity of 11,512 acre feet is included herewith. This tabulation is incomplete in that not all tanks are included nor have all approved tanks actually been constructed.

Due to time and personnel limitations, few inspections of construction have been made. Most sites are visited and inspected prior to approval of the applications.

The location and number of these tanks by district are as follows:

DIST.	NO.	DIST.	NO.
1	4692	8	1438
2	62	9	48
3	110	23	300
4	78	48	-
5	12	49	400 [±]
6	62	64	308
7	32	65	392

VII.

WATER RIGHTS

A. TABULATION

We have received approximately 350 objections to the tabulation to date. Of this number, about 200 have been completed. We estimate the time necessary for completion to be at least 90 days.

About September 10th we had many complaints on the short objection period. Another big complaint is the lack of water district lists. If we could furnish all water attorneys and irrigation companies with these lists, it would help tremendously in putting the final tabulation in acceptable shape.

March 22, 1971

As of this date it is estimated that 15 days will be required for completion of the objections in hand.

VII.

WATER RIGHTS

B. Referee's Findings and Decrees

The number of applications made to the Water Court in Greeley through January 1971 are as follows:

(1) Underground Water Right	557
(2) Change of Water Right	43
(3) Plan for Augmentation	52
(4) Water Right	174
(5) Diligence (Cond. Decrees)	45
(6) Water Storage Right	90
	<u>961</u>

Most of the 95 applications made for change of water right and plans for augmentation involve wells as alternate or primary points of diversion.

Many well owners have not taken advantage of the provision for tying wells to surface decrees because they don't understand fully what the eventual consequences of that action might be.

The applications received to date have been submitted by persons wishing to protect the original appropriation date of their wells. The large majority of well owners, however, have not yet been heard from. The reason for this, we feel, is that they are not yet aware of the need to adjudicate.

SUMMARY OF WATER COURT ACTIONS

COURT ORDERED

	Prior to 12-1-70	Total Prior to 3-22-71	Referee Rulings Pending Court Approval
(1) Underground Water Right	4	51	44
(2) Change of Water Right	1	11	-
(3) Plan For Augmentation	-	-	-
(4) Water Right	9	40	23
(5) Diligence (Cond. Decrees)	-	10	5
(6) Water Storage Right	3	20	7

RECOMMENDATIONS AND SUGGESTIONS

A. PERSONNEL

The work load in Division No. I is increasing steadily due to rapidly developing pressure on our water resources. Perhaps the greater pressure is the result of growing public awareness of demands on our water supply that have been present for some time. Whatever the reason, it is clear that improved and extended administration is desirable. For instance, at the present time we have neither the time nor manpower to properly inspect construction of wells, stockwater tanks and irrigation structures, or check on well use, isolated diversions, adequacy of structures, etc.

Our water commissioners and deputies are to be commended on their efforts in the distribution of water and in maintaining good public relations. To do the complete job that we are necessarily going to expect, they will need more help. The number of new positions necessary depends upon the extent and degree of administrative detail that is practical at this time.

The hydrographic section in this division has also accomplished more this year than in the past. Some new stations have been added, duties have been realigned and additional men employed. Further expansion in personnel would provide opportunity for some seepage studies and improved flow determinations.

If pending legislation becomes law, requiring the division engineer to investigate and make recommendations to the water court on all water right applications, additional staffing of engineers and clerical help will be very necessary in the division office. Increased staffing will require more office space.

Obviously the aforesaid expansion of personnel will require greater budget appropriations. Consequently, the division's administrative projections must be balanced by available funds.

The current budget is causing some curtailment in the allowable part-time employee use and travel expenses. This situation defeats some of our goals in gathering field information. Of particular importance at this time is the locating of small, relatively unimportant diversion facilities and establishing a record of use for all water rights. This history of use will be very important in considering abandonment actions as directed by statute.

B. RECORDS

In the year and one half since the division office was moved to Greeley, the inflow of paper work and subsequent filing has caused some concern of eventually being inundated by paper. Filing space will be at a premium in the not too distant future. The present types of reports submitted by the

X.

B. RECORDS (Continued)

water commissioners, although providing more and better information than the previous type, still are time consuming in preparation, often duplicative in nature and certainly voluminous. Some thought has been given to data processing as a means of maintaining records. A procedure requiring that any particular entry be made only once and be retrievable individually or in any combination would be most desirable. Presently, plans are being formulated to run a pilot program of data processing for some selected districts to perfect the procedure.

C. TABULATION

The initiation of the tabulation of water rights as required by the Water Rights Determination and Administration Act of 1969 soon revealed the complexity of the task. Through the conscientious efforts of the division and the state office staffs, the required list was completed and published in July 1970. As was expected, several errors and some omissions were made and are now being remedied.

The published tabulation, itself, generated considerable unfavorable comment. Many water users and ditch officials experienced difficulty in finding and interpreting their water rights and remain concerned whether said rights appear in proper relationship to other rights with which they are unfamiliar within the division.

It is recommended that, in addition to a master tabulation which will be an inventory of water right actions, additional lists be made available of former water districts showing only current active rights and indicating decrees subject to specific conditions.

D. STOCK WATER TANK LISTS

The present printout of the stock water tank list appears to be incomplete in that not all such structures are included and some that are included have never been built. Many of the owners' names have changed since approval of plans, making it difficult to find the information in the list. If the lists were printed with the entries in geographical order, such as is true of the well registration printout, it would aid the administrative officials in their field work.

Further, aerial photos would be of great assistance in locating and checking structures of this type.

E. POLLUTION

It would probably be desirable to have the entire staff better informed on their responsibilities and limits in matters of pollution and the actions that are taken by other agencies in this respect.

X.

F. FLOOD PLAINS

As population pressure increases and land becomes more valuable, the encroachment of industry, housing, roads, etc., upon the flood plains of the various streams presents the problems of flood hazard, property damage and loss of life itself.

The Department of Natural Resources has a vital concern in this area and should take an active part in planning and zoning to minimize the problems for the future.
