

ANNUAL REPORT DIVISION NO. 6

I. Introductory Statement

Division No. 6 encompasses the Northwestern corner of Colorado including the North Platte, Yampa, Green, Little Snake and White River Drainage Basins. Elevations range from 14,000 feet in the Eastern portion to around 5,000 feet in the west including rugged mountains, irrigated valleys, farmed mesas, desert ranges and the beautiful canyon country of the Yampa and Green River. The annual precipitation varies from 7 to 9 inches annually in the western winter ranges to over 40 inches in the high mountains with the average of 16 to 23 inches in the crop producing portions of the Division.

The bulk of the precipitation is in the form of snow during the winter months with some areas having summer precipitation enough to support small grains and some dry land hay.

The population in Division No. 6 is sparse with most of the population being in Craig, Steamboat Springs and Meeker. Probably the most rapidly increase in population is the Steamboat area with the others showing a small steady increase.

Most of the irrigation is on mountain meadows producing hay and irrigated pasture. This acreage is approximately as follows for the various drainages; Yampa River 80,400 acres, White River 27,000 acres and 120,592 acres for the North Platte drainage. The dry farming in the North Platte drainage is practically non existant due to the short growing season and a minimum elevation of over 8,000 feet.

The dry crop acreage in the Yampa drainage is approximately 131,000 acres with 17,000 acres of dry crop land in the White River drainage.

The bulk of the dry crop land is planted to wheat, oats, and barley. The dry land is generally summer fallowed which for the most part means only 50% of the land is in production annually.

The major industry in the division is still basically agriculture, mainly, livestock production. Recreation is becoming more of a lucrative occupation with Steamboat Springs area and upper White River being the hub of this activity at the present with the ski resort at Steamboat Springs being the main attraction, however, the summer recreation is also becoming increasingly important in all of the division.

A steam generating development utilizing huge coal deposits is in production at the Colorado Ute Hayden Plant. This probably constitutes the largest industrial growth potential of any with 5 or 6 such plants being studied for the White and Yampa drainages. Public Service of Colorado at the present time freights most of the coal produced in three strip mines to their East Slope plants.

Most of the water projects in operation at the present are small irrigation reservoirs with a few recreation reservoirs being built by the Colorado Game and Fish Department.

The Savory-Pot Hook Project, a joint Colorado-Wyoming project on the Little Snake River drainage, has been authorized and the advanced plants are near completion. Congress has supposedly written in funds to start construction in 1971.

II. Personnel

A.

<u>NAME</u>	<u>POSITION</u>	<u>DISTRICT</u>	<u>MONTHS WORKED</u>	<u>MILEAGE</u>
Clarence Johnson	Water Commissioner 1	43	7 3/5	11063
Roy D. Steffen	Water Commissioner 1	44	8 2/5	9793
Neil Black	Water Commissioner 1	47	3 1/2	1843
Donald C. Gilroy	Water Commissioner 1	54	5	5670
Jack Leonard	Water Commissioner 1	55-56	3 1/10	5177
James E. Sellers	Water Commissioner 1	57	7 1/3	6821
Charles Gregory	Water Commissioner 1	58	8 2/5	8358
Billy Milner	Deputy Water Commissioner	58	7 2/5	5134
R. Wayne Light	Water Commissioner 1	58	8 2/5	6131

III. Water Supply

A. The snow pack was substantially above normal in all of the drainages with the May 1st averages as follows:

<u>Watershed</u>	<u>No. of Courses Averaged</u>	<u>% Last Year</u>	<u>% Average</u>
Elk River	3	201	180
North Platte River	5	165	157
White River	2	239	166
Yampa River	6	228	163

The snow melt was slow and the rivers were relatively high for a long period but there was no extensive flooding as was feared considering the size of the snowpack.

B. The precipitation was above normal during the month of June at most of the weather stations in the Yampa River drainage. It was 50% to 75% above normal at some of these stations. The White River and the North Platte River Drainages were near normal for June. June is normally the dry month for Division No. 6 and is the month that the bulk of the growing for most crops is critical. Above normal precipitation during this period is inducive for high production on dry crop lands.

July and August were near normal in the White and North Platte drainages with some below normal recordings at lower stations in the Yampa drainages.

Early fall storms made September and October normal or above in most of the drainages.

The combination of high June precipitation and higher than normal river flows made an abundance of irrigation water during the most of the irrigation season.

C. High flooding conditions were expected during snow melt because of the above average extent of the snowpack. Actually, near flood conditions existed during an extended period but actual damage was limited. With the exception of a few isolated thunderstorms below 6,000 feet elevation, the flooding in Division No. 6 is almost exclusively snow melt.

Most of the flooding is usually limited to low flood plains along the lower White and Yampa Rivers. Occasionally a situation exists in late winter that is caused by a thaw and is followed by ice jams which cause flooding and extensive damage. So far this has been limited to the lower reaches of White River and the Lower portion of the Little Snake River.

D. The information for the Water Budget is not available at this time but will be presented at such time that the information is available from the U.S.G.S.

E. Underground Water

<u>District</u>	<u>Irrigation</u>	<u>Municipal</u>	<u>Commercial</u>	<u>Stock & Domestic</u>
43	13	3	35	84
44	6		12	188
47	1	3		61
54			1	10
55	1		5	18
56			4	7
57	1		2	28
58	1		2	100

The wells in Division No. 6 are not numerous enough at the present to deplete any aquifer to any noticeable extent. The total irrigation wells are 23 with a capacity of 25 c.f.s. and many of these are inactive in an agriculture producing capacity. The most water, 58.5 c.f.s., is allocated to commercial wells. These wells have been drilled for the most part in the Piceance Basin by Oil Companies in contemplation of future oil shale development and are capped and not in use at present.

The domestic stock wells are small and do not amount to much water in the division, however, in the light of subdividing and recreation this type of development could well be a source of much controversy in the future.

Actually, not much information is available on ground water in the Division. The USGS have made a study on the Piceance Basin which shows a large reservoir of underground water. The USGS are at the present making a study of the whole Colorado River Drainage which should be complete in a couple of years.

IV. Agriculture

The White River Drainage has almost twice as much irrigated land as dry crop land. Most of the irrigated land is in hay production for livestock feed. This land is probably about equally divided between wild meadow hay and alfalfa. The average production on wild hay is around 2 to 3 ton to the acre with alfalfa being slightly higher. Alfalfa for the most part produces two cuttings of hay per season. The dry crop land is almost exclusively in the production of small grains, wheat, oats and barley. The production on these, of course, varies greatly in proportion to the climatic conditions. The average for wheat is around 26 bushels to the acre with oats and barley slightly higher. The bulk of the dry crop land is fallowed which cuts production to something over 50% of the total acreage annually.

The Yampa Drainage has about 40% more dry crop land than irrigated. The dry crop land in the Yampa Drainage is almost identical to the White River Drainage with the exception that a small portion of it is in the production of hay. This dry land hay is for the most part alfalfa and generally only cuts one crop of hay. The wheat yield for the Yampa Drainage is around 30 bushels per acre. The hay in the Yampa drainage is predominately wild hay with a yield of 2 to 3 ton to the acre.

The North Platte Drainage is almost exclusively wild hay with a average yield of around one ton per acre. The elevation of the North Platte is high and the growing season is short.

The prices of most of the produce in the area is down some what to what it was one year ago. Wheat is one exception. It is up slightly.

In the overall picture, the price of farm produce has not kept pace with the inflation of costs. The result is that the economy of the area is down. The only thing that has kept a good many of the ranchers and farmers in business is the increase in their land values which they borrow on to keep operating.

V. Compacts and Court Stipulations

The Colorado River Compact and the Upper Colorado River Compact are still no problems to live with. However, it is contemplated that in the near future there will be changes in this. A trip was made to Utah to see what the Indians are doing on the lower White River. They are developing land for irrigation at the present and the potential is such that this could well produce problems in the future. Another area that could well be a problem area in the future is the Little Snake between Wyoming and Colorado. These are not mentioned as areas to borrow trouble but merely as areas that are situated such that any action that can be taken to forestall difficulty should be followed.

The stipulations called for in the Supreme Court Case between Colorado, Wyoming and Nebraska on the North Platte have been complied with and a report will be supplied to the proper authorities concerning the irrigated acres and storage water in the 1970 irrigation season.

The agreement with Utah concerning the Pot Creek drainage needs some updating in several different aspects and will probably require a meeting with the Utah State Engineer in the coming months.

There is still room for more and more thorough dam inspections. However, probably more dams have been inspected this year than any other year I have worked as Division Engineer. Two dams, Cove and Cove Lake Dam in District 44 have been drained and will remain so until Mr. Mack has complied with the State Engineer's orders on repairs. The Laune Reservoir (North Delaney Butte) has been built without plans and specifications and is in the hands of the State Engineer's Dam section. The Big Creek Lake Reservoir Dam needs repair. Other than some minor repairs and restrictions, this brings the dams in Division 6 in fair condition.

VII. Water Rights

A.

The tabulation has been tentatively corrected with the exception of White River.

The White River tabulation is currently being checked with the court record. It would appear that this should be done with all of the tabulation for there has been several things brought to light that was not in our records. It would appear that our corrections will run over 25 per cent. I would like to have untill spring at least to finish the corrections.

The public, in general, has accepted the tabulation. I have the feeling that it is somewhat overwhelming to the bulk of the water users.

VII. Water Rights

B.

DIVISION NO. 5

1. Underground Water Right	0
2. Change of Water Right	1
3. Plan for Augmentation	0
4. Water Right	13
5. Diligence (Cond. Decree)	37
6. Water Storage Right	6

DIVISION NO. 6

1. Underground Water Right	0
2. Change of Water Right	0
3. Plan for Augmentation	0
4. Water Right	2
5. Diligence (Cond. Decree)	0
6. Water Storage Right	1

One well was used as an alternate point of diversion for a water right. This was in the Piceance Creek Basin and is to be used for experimental purposes in extracting oil from oil shale. Actually, there are not enough wells in Division No. 6 to make to much difference for the most part, they have done nothing.

VIII. Organizations

A.

Colorado River Water Conservation District - Glenwood Springs, Colorado
Roland C. Fischer, Secretary Engineer

Upper Yampa Conservancy District - Steamboat Springs, Colorado
Nicholas Magill, Attorney

Yellow Jacket Conservancy District - Meeker, Colorado
Robert Raley, President

Pot Hook Conservancy District - Baggs, Wyoming
Darwin Dunn, President

Lower Yampa Conservancy District - Craig, Colorado
Jack Davis, Attorney

Great Northern Conservancy District - Craig, Colorado
John Sherman, President

B.

Bear River Reservoir Company - Yampa, Colorado

Stillwater Ditch Company - Yampa, Colorado

Maybell Irrigation District - Maybell, Colorado

Miller Creek Ditch Company - Meeker, Colorado

Woodchuck Ditch Company - Steamboat Springs, Colorado

IX. Water Commissioner's Summary

District No. 58

Direct Flow -----	133,197 Ac.Ft.
Reservoir Storage -----	8,597 Ac.Ft.
No. Ditches -----	457
Acres Irrigated -----	48,761 Acres
No. Reservoirs Served --	30
Acreage Demand -----	2.73 Ac.Ft./Acre

District No. 57

Direct Flow -----	70,921.35 Ac.Ft.
Reservoir Storage -----	2,268.4 Ac.Ft.
No. Ditches -----	124
Acres Irrigated -----	15,097 Acres
No. Reservoirs Served --	10
Acreage Demand -----	4.69 Ac.Ft./Acre

District No. 56

Direct Flow -----	18,825 Ac.Ft.
Reservoir Storage -----	64.8 Ac.Ft.
No. Ditches -----	69
Acres Irrigated -----	2,214 Acres
No. Reservoirs Served --	6
Acreage Demand -----	8.52 Ac.Ft./Acre

District No. 55

Direct Flow -----	8,040 Ac.Ft.
Reservoir Storage -----	0
No. Ditches -----	13
Acres Irrigated -----	911 Acres
No. Reservoirs Served --	0
Acreage Demand -----	8.82 Ac.Ft./Acre

District No. 54

Direct Flow -----	27,723 Ac.Ft.
Reservoir Storage -----	413 Ac.Ft.
No. Ditches -----	91
Acres Irrigated -----	11,425 Acres
No. Reservoirs Served --	3
Acreage Demand -----	2.42 Ac.Ft./Acre

District No. 47

Direct Flow -----	134,080 Ac.Ft.
Reservoir Storage -----	5,523.5 Ac.Ft.
No. Ditches -----	61
Acres Irrigated -----	35,769 Acres
No. Reservoirs Served --	14
Acreage Demand -----	3.74 Ac.Ft./Acre

District No. 44

Direct Flow -----	94,893 Ac.Ft.
Reservoir Storage -----	1,763 Ac.Ft.
Acres Irrigated -----	28,608 Acres
No. Ditches -----	250
No. Reservoirs -----	5
Acreage Demand -----	3.32 Ac.Ft./Acre

District No. 43

Direct Flow -----	251,498 Ac.Ft.
Reservoir Storage -----	0
No. Ditches -----	419
Acres Irrigated -----	38,180 Acres
No. Reservoirs Served --	0
Acreage Demand -----	6.58 Ac.Ft./Acre

X. Recommendations and Suggestions

There have been more changes in the State Engineer's Office this year than in the last eleven years that I have worked for the organization and probably many years before that. This, I feel, is good for many changes were certainly in order. Considering the fact, the only one that doesn't make errors is the one that does nothing, probably many errors have been recorded during this past year.

The tabulation has caused much work and there is, at least in Division No. 6, much more to do. I feel that all parties working on this should be brought together and all problems involved be discussed in detail in an attempt to straighten out many differences that exist. I feel that the tabulation is good and every attempt should be made to make it as perfect and workable as possible.

The Water Commissioner's report and the Division Engineer's report should be made to coincide more than they have this year but this is a small problem and can be easily resolved if the Engineer's report is near the same for the following year. I would suggest, if changes are in order, that they be made before the start of the irrigation season.

I would like to thank the State Engineer's office for their cooperation and help during 1970. I would also like to commend and thank the personnel of Division No. 6 for their work and cooperation during the past year.
