FOR PLANNING PURPOSES ONLY

The Colorado Division of Aeronautics assumes no responsibility for information contained in this directory nor any action taken by the pilot based on this publication. This publication was produced and printed by the Colorado Division of Aeronautics with funds from the user-supported Colorado Aviation Fund, and approved by the Colorado Aeronautical Board. No general fund dollars were used to produce this publication.

Colorado Department of Transportation

Mission Statement

The Division of Aeronautics will collaborate with its public and private constituents to develop an effective air transportation system and to enhance aviation safety and education through the efficient, innovative and non-regulatory administration of the Colorado Aviation Fund under the direction of the Colorado Aeronautical Board.

FOREWORD

Dear Aviators, welcome to our wonderful state of Colorado. We live and work in a state blessed with a wide range of beauty from the plains of eastern Colorado to the majestic mountains of the continental divide. And our outdoor spirit attracts enthusiasts to our national parks, forests, grasslands, mountains and 42 state parks for skiing, hiking, wildlife watching, hunting, fishing and many more activities that has made our state known worldwide.

Our state is also known for its multi-modal transportation system which includes the Denver International Airport-the 5th busiest commercial service airport in the country, a great interstate road system that bisects the state from the east, west, north and south and a great system of airports that provides air access to the four corners of our great state.

The Division of Aeronautics is proud to produce this new edition of the Colorado airport directory. The directory includes updated information on the 76 public-use airports. As you use the directory for your air travels across the state please bear in mind that changes might have occurred since this printing, so please check with the FAA Flight Service Station (FSS) for NOTAMS, the Aeronautical Information Manual (AIM), the National Weather Service (NWS) and the various airport operators in advance of your flight to ensure you have the most accurate information available.

Safe travels and have fun!

Dave Gordon, A.A.E.
Director
CDOT- Division of Aeronautics

Glossary

AGL (Above Ground Level)-Elevation above ground level measured in feet.

ASOS/AWOS (Automated Surface Observation System/Automated Weather Observation System)-Electronic device providing 24-hour, real-time weather information to pilots via phone or direct radio frequency.

ASPH-Runway surface constructed with asphalt.

ATIS (Automatic Terminal Information Service)-Continuous broadcast of local weather and airport conditions utilizing a discrete frequency.

CLNC DEL (Clearance Delivery)-Operating position in the control tower responsible for issuing clearances to pilots.

CONC-Runway surface constructed of concrete.

CTAF (Common Traffic Advisory Frequency)-Frequency designed for airport advisory practices while operating to or from a controlled airport.

DME (Distance Measuring Equipment)-Permits pilots to determine aircraft's distance from a ground station; usually co-located with a VOR or ILS.

FSS (Flight Service Station)-Air traffic facility providing pilot briefings, en route communications, and VFR search and rescue missions.

GRVL-Runway surface consisting of gravel.

Heavy Aircraft-Aircraft weighing more than 12,500 lbs. MGTW.

HIRL (High Intensity Runway Lights)-Runway lighting primarily used on instrument runways and having five-step lighting variance capability.

IFR (Instrument Flight Rules)-Rules governing conduct of aircraft during instrument flight.

ILS (Instrument Landing System)-Precision approach and landing aid.

Light Aircraft-Aircraft weighing less than 12,500 lbs. MGTW.

LIRL (Low Intensity Runway Lights)-Runway lighting system with a one-step variance capability.

MALSR (Medium Intensity Approach Lighting System with Runway Alignment Indicator Lights (RAIL)-Approach lighting system using runway alignment indicator lights with three-step light variance capability.

MGTW (Maximum Gross Takeoff Weight)-Maximum weight approved for the start of a takeoff roll.

MIRL (Medium Intensity Runway Lights)-Runway lighting system with three-step variance capability.

MSL (Mean Sea Level)-Elevation above mean sea level measured in feet.

NDB (Non-Directional Beacon)-Radio navigation beacon that transmits a uniform omnidirectional signal using a low or medium frequency band.

Nav aids (Navigational Aids)-Any electronic device used by pilots for navigational purposes.

NSTD Non-Standard

NWS (National Weather Service)-Agency charged with collecting, disseminating, and forecasting weather conditions for the public.

P2L-Two-box PAPI system positioned on the left side of the runway.

P4L-Four-box PAPI system positioned on the left side of the runway.

P2R-Two-box PAPI system positioned on the right side of the runway.

P4R-Four-box PAPI system positioned on the right side of the runway.

PAPI (Precision Approach Path Indicator)-Visual navigation device permitting pilots to judge the aircraft position relative to the glide path.

RCO (Remote Communications Outlet)-Unmanned communication facility used by controllers to communicate between FSS and pilots.

TPA (Traffic Pattern Altitude)-Altitude at which aircraft traffic pattern is to be flown.

TRIL -Tricolor visual approach indicator on the left side of the runway.

UNI (Unicom)-Non-Federal communications facility providing airport information at certain airports.

VASI (Visual Approach Slope Indicator)-Airport lighting system providing vertical guidance to the runway.

V2L-Two-box VASI system located on the left side of the runway.

V2R-Two-box VASI system located on the right side of the runway.

VFR (Visual Flight Rules)-Rules that govern the procedures for conducting flight under visual conditions.

VORTAC (VHF Omnidirectional Range Tactical Air Navigation)-Navaid facility providing VOR azimuth, TACAN azimuth, and TACAN DME at one site; can be used by VOR-DME or TACAN equipped aircraft.

Mountain Flying Safety Information

The performance charts for general aviation single and light twin aircraft are to be utilized with caution. Performance charts for some older aircraft do not extend to the altitudes and airport elevations found in the Rocky Mountains. The chart figures are derived with a new airframe, new engine and with a test pilot at the controls. It is reasonable that some “buffers” need to be applied to arrive at the real world capabilities of any aircraft which is operated in the high country.

The following information is to provide guidelines for safe flying in the high country during the takeoff, en route, approach and landing phases of flight. These are the guidelines used by flight instructors and pilots with many years of safe mountain flying experience.

THE DON'T OF MOUNTAIN FLYING

LIGHT TWIN AIRCRAFT

- Do not attempt night flight operations, unless on a single engine the aircraft is capable of maintaining at least 16000 feet MSL.
- Do not attempt IFR operations unless a current and qualified two person crew is on board and they have familiarity with the obstruction departure and destination approach and landing procedures.

SINGLE ENGINE AIRCRAFT

- Do not attempt night operations – ***EXTREMELY DANGEROUS***
- Do not attempt IFR operations

SINGLE OR LIGHT TWIN ENGINE AIRCRAFT

- Do not attempt mountain flying if the 9000 and 12000 foot winds are forecast to exceed 30 knots. Winds aloft may be accompanied by severe turbulence, with down drafts exceeding the climb capability of the aircraft.
- Do not attempt a takeoff unless the loaded aircraft is below 10% the FAA certified gross weight, and the CG is within limits.
- Do not attempt a mountain flight unless the ceilings are at least 2000 feet above the highest terrain and visibility is at least 15 miles

Night and IFR operations are best left to commuter airline, medical evacuation and corporate crews using fully capable and equipped aircraft. All other pilots should operate in day, VFR conditions if safety is to prevail.

THE DO'S OF MOUNTAIN FLYING

- Do plan the fuel load to arrive at the destination with a minimum one hour fuel reserve. Strong crosswinds or a disabled aircraft on the runway may require a diversion to an alternate airport.
- Do plan a definite altitude to be flown on each segment of the flight. Consult the sectional chart.
- From over a plotted checkpoint, turn the aircraft to the next planned magnetic course and make a mental note of the observed features along that course. Movement from one ridge line to another may be necessary in climbing toward the pass. Some zigging and zagging across the ridge line you are following may be needed to remain in the best updraft along a ridge. Do not lose site of the desired points along the segment being flown.
- Always file a flight plan, keep a flight log and make position reports at every opportunity. Close flight plan after arrival at the destination.
- Do have an operable ELT on board.
- Do have a suitable emergency kit to include a supply of water, signal mirror, whistle and extra clothing as appropriate.
- During the summer, terminate flying activities no later than 1:00 PM MDT.
- Do ask for advise and assistance from FBO, FAA personnel, local mountain qualified flight instructors and pilots. These individuals will be friendly and willing to help.

ITEMS FOR EXTRA ATTENTION IN MOUNTAIN FLYING FLIGHT PREPARATION

- Get a complete weather briefing, including pilot reports for your proposed route. Make note of the winds aloft, altimeter settings, surface winds and NOTAMS for all en route airports and destinations.
- Consult POH for takeoff, climb and ceiling capabilities of the aircraft being flown. When calculated climb rates are less than 200 feet/NM, do not depart.
- A high density altitude may prevent you from reaching the altitude listed in the POH as the service ceiling.

ENGINE START

- For normally aspirated, fuel injected and turbo charged engines, use normal starting procedure and as soon as the engine starts, lean the mixture until the engine runs smoothly.

RUN UP

- Enrich the mixture slightly before beginning the run up. As the run up is completed, advance the throttle to full power and re-lean the mixture as appropriate for the engine being operated. This procedure will provide the proper mixture for takeoff power.

TAKEOFF

- Taxi into position as near the departure end of the runway as practical, hold the brakes and apply full power. Make a power check and release the brakes.
- Climb out with takeoff power and the best rate of climb IAS to at least 1000 feet above the departure airport. Some situations may require takeoff power and best rate of climb IAS to 2500 feet!
- The use of flaps for takeoff may significantly reduce climb performance. Check the POH or make a local inquiry.

EN ROUTE

- Plan to cross all passes and terrain with a minimum 1000 foot clearance. Know these elevations and use the altimeter – DO NOT GUESS.
- Monitor the rate of climb when climbing across terrain; shuttle climb if necessary.
- Cross all passes at a 45 degree angle so a turn toward lower terrain can be accomplished with 90 to 120 degrees of turning. (Escape Maneuver)
- Reach pass crossing altitude (1000 feet above pass terrain) 3 miles before reaching the pass.

DESCENT

- Descents may involve rough air. Be prepared to make a slow speed at maneuvering speed (but no slower than best angle of climb).
- At pattern altitude, briefly bring the engine to full power while adjusting the mixture to insure full takeoff power is available if it becomes necessary.

APPROACH AND LANDING

- Study the destination airport data before departure.
- Due to the proximity of terrain or obstacles, some mountain airports have:
 - left hand patterns for one runway and right hand for the other
 - ingenious descent paths in a valley for a straight in approach
 - preferred landing and departure runways
- When in doubt ask the tower, if one is in operation, UNICOM or another pilot if one is airborne in the vicinity.
- Identify the planned touchdown point on the runway and go for it at the appropriate airspeed and aircraft configuration
- The appropriate IAS is 1.3 times the stall speed in the configuration for the wing. Excessive speed is undesirable.

MOUNTAIN FLYING IN WINTER

- Winds aloft, during winter months, are frequently too strong for safe mountain flying in general aviation aircraft.
- Mountain top winds of 40 to 60 knots are not uncommon during the period from December through March. Occasionally wind speeds greater than 80 knots may occur and continue for several days.
- The prudent pilot will check in advance to learn whether the desired services are available at the mountain destination airport.
- Winter operations can be pleasant and safe when all safe operating requirements are met.

RECOMMENDATIONS

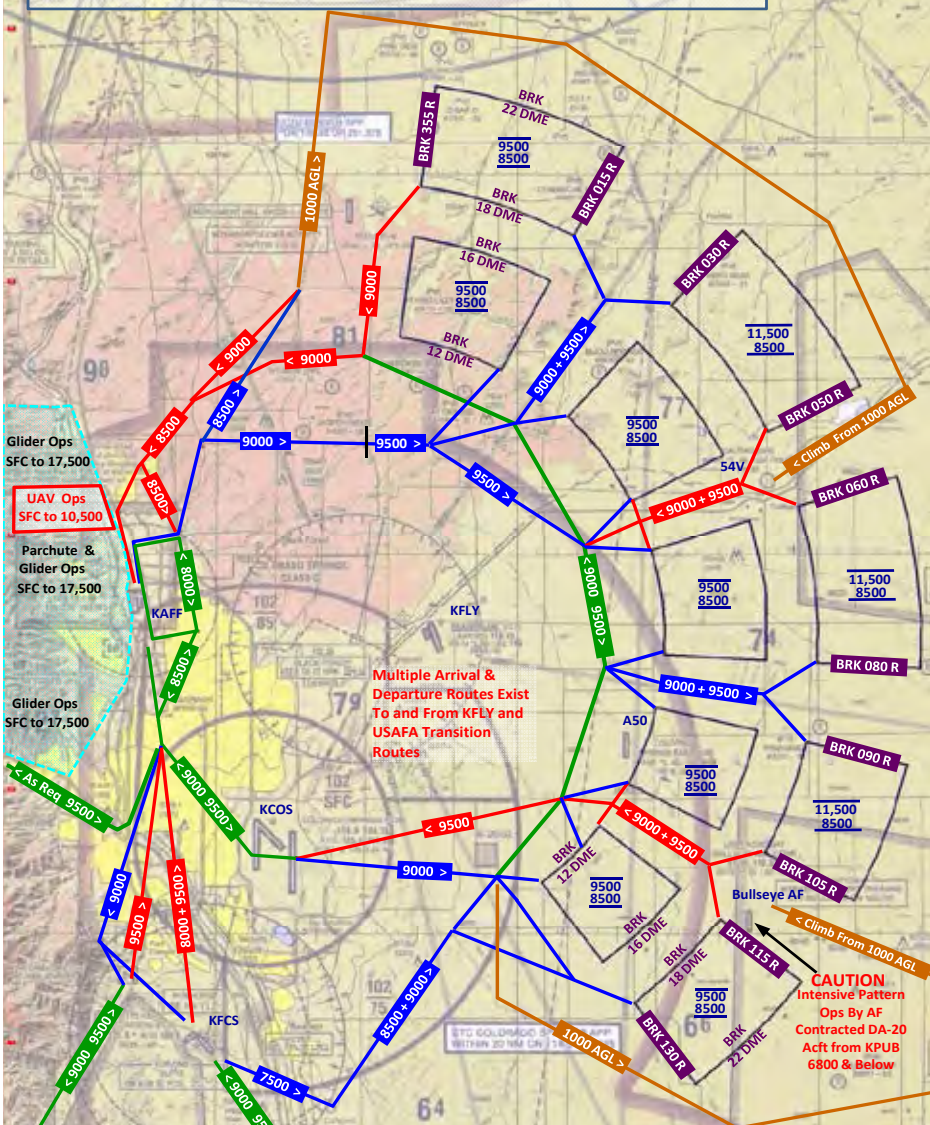

- Attend a mountain flying training course which includes a ground school and mountain training flight. Such training is available through the Colorado Pilots Association, Denver, CO, American Bonanza Society, Wichita, KS, and others. Individual training is also available through several highly experienced mountain flying instructors in Colorado. Contact the Colorado Pilots Association (303) 367-0670 or visit www.coloradopilots.org for further information.
- All adverse weather situations are magnified in the mountains.
- Adhere to the weather requirements mentioned previously, or if not possible, park the airplane at an airport at the edge of the high country and continue the trip by automobile.
- Nothing you want to do tomorrow is worth risking your life and the lives of your passengers today!
- If a bad operating situation is encountered, proceed to an alternate. The best alternate may be the airport of departure.

Air Force Academy (USAF) Flight Ops, Vicinity Colorado Springs CO

Chart identifies major changes to USAFA flight operations in response to newly implemented FAA RNAV procedures into KAPA and KCOS Airports beginning 3 Dec 2012. USAFA conducts operations sunrise to sunset, Mon thru Fri and occasionally on Sat & Federal Holidays.

Legend For Cirrus SR-20 & Cessna 150 /172 Type Aircraft

- < 9000 9500 > Bi-directional Route with altitudes for separate directions
- 9500 > KAFF Departure Route to Training Areas with altitude and direction arrow
- < 9500 KAFF Arrival Route from Training Areas with altitude and direction arrow
- 1000 AGL > Low Level Navigation Route 1000 AGL with altitude and direction arrow
- All Altitudes in MSL Unless Otherwise Indicated
- 9500 8500 VFR Training Area working altitudes

Not For In Flight Navigation

FAA Terminal Area Chart Scaled to 1:555,556, Printed 03 Dec 2012

Chart depicts volume flight training operations only. Some operations are not depicted due to chart size or limited number of operations. Contact POC identified below for additional details. Information Subject to Change: See Special Notice Section FAA's Airport Facility Directory for updates.

Pilots are highly encouraged to contact DEN/COS Approach for traffic advisories as USAFA & USAF contracted aircraft at PUB are extremely difficult to acquire visually

Doss Initial Flight Screening Flight Ops, Vicinity Pueblo, CO

IFS TRAINING AREAS AND ROUTES

- High-volume flight training within 28nm of KPUB.
- Areas 1-27 in use weekdays, SR-SS, 500 AGL to 8000 MSL.
- IFS aircraft departing KPUB to Areas maintain 7500 MSL.
- IFS aircraft inbound KPUB from Areas maintain 6500 MSL and 6000 MSL.
- Overhead pattern in use at KPUB. Initial Approach 6000 MSL.

RECOMMENDATIONS TO AVOID TRAFFIC CONFLICT

- Contact Denver Approach 120.1.
- Overfly IFS training areas 1-27 at 8500 MSL or above.
- Overfly Fowler (CO80) at 7500 MSL or above.
- Avoid Hwy 50 between Avondale and Fowler below 7000 MSL.

Survival Tips

- After an emergency landing, exit the aircraft and give temporary first aid to permit careful removal of passengers from the aircraft.
- Stay away from the aircraft until engines have cooled and spilled fuel has evaporated.
- When everyone is a safe distance from the aircraft, reevaluate injuries and treat as necessary.
- If weather is adverse, make or find temporary shelter while evaluating dangers of aircraft location (fire, avalanche, terrain, water, etc.)
- Stay close to the aircraft for shelter, warmth and signaling, if possible.
- Make sure ELT is working.
- Signal for help. Try to use the aircraft radio by turning the squelch, turning the volume and keying the mike. If the radio is operational, listen on a local or ATC frequency. If you hear a transmission, transmit "Mayday, Mayday".
- If you hear a jet, transmit on 121.5 (or transmit blindly) only every 15 minutes to save battery power. If ELT and radio are working, you will hear the ELT signal on 121.5. Do not forget to turn the ELT back on. Conserve your energy and do not spend too much time trying to signal in cold or wet weather conditions.
- Use wings, rudders, maps, tarps, etc. to build and insulate a small shelter for your body to heat. Loss of body heat is loss of energy.
- Think basic needs and utilize the aircraft for warmth, shelter, tools and bedding when possible.
- Build a fire if possible. Smoke and fire can be seen for long distances. Aircraft gasoline is a good resource in starting a fire when only wet wood is available, but BE CAUTIOUS. Soak or pour gasoline on the wood. Ensure gas container is out of reach when igniting the fire. Do not burn paper as it is valuable insulation and bedding source. Gather resources in advance to keep the fire burning for a long period of time.
- Use aircraft insulation and upholstery for overboots, mittens, bedding, hats and ground insulation.
- Use plastic or waterproof source to melt ice/snow or collect condensation from aircraft surfaces. If it is raining, put plastic in depression in the ground to collect water.
- Rescuers will be looking for smoke, fire, flares, and a downed aircraft. Clear the area around the aircraft, use a mirror for signaling, or form SOS with brush in an open space or in the snow if possible.
- **Stay calm, be smart and conserve energy. Survival will depend greatly upon your state of mind.**

Density Altitude Chart

Operational altitude is the altitude of the air at which the aircraft is flown. Aircraft operation, as a result, may be at an altitude greater or less than the actual altitude above sea level.

Wind Components

This crosswind component chart provides at a glance the effect current wind velocity and direction will have upon your take off. For example, a 25 knot wind at a 30 degree angle to either side of the runway heading has the same effect as a 13 knot crosswind. For more details on the effect of wind on your airplane at take off or landing, consult aircraft owner's manual.

Colorado Mountain Passes

Berthoud

Route: Denver west to central mountains. Road elevation 11,315' MSL. This pass is not visible to any weather reporting stations. N39-47-20, W105-47-06.

Cameron

Route: Fort Collins west to northern mountains. Road elevation 10,276' MSL. This pass is not visible to any weather reporting stations. This is a planned future AWOS site. N40-31-21, W105-53-32.

Cochetopa and North

Route: West to south central mountains, i.e. Gunnison area from San Luis Valley, Alamosa, Salida, and Pueblo areas. Road elevations - Cochetopa 10,067' MSL, North 10,149' MSL. The vicinity of these adjacent passes is partially visible from Alamosa and Gunnison weather reporting stations. Elevations and weather often favor these passes over Monarch Pass. N38-09-22, W106-36-21.

Corona (Rollins)

Route: North Denver west to central mountains. Trail elevation 11,671' MSL. This pass is not visible to any weather reporting stations. Expect turbulence and strong down drafts with west and northwest winds aloft. N39-55-06, W105-40-41.

Cottonwood

Route: Eagle to Carbondale and Aspen. Approximate trail elevation 8,500' MSL. This pass is partially visible to a weather reporting station at Eagle. N38-49-44, W106-24-44.

Cucharas

Route: Southeastern plains to San Luis Valley and Alamosa. Road elevation 9,941' MSL. This pass is not visible to any weather reporting stations. N37-18-38, W105-04-09.

Cumbres and La Manga

Route: Alamosa to Durango. Road and track elevations - Cumbres 10,022' MSL, La Manga 10,230' MSL. The vicinity of these neighboring passes is visible from weather reporting stations at Alamosa and Durango. N37-01-34, W106-28-21.

Douglas

Route: Northwest Colorado to Grand Junction. Road elevation 8,268' MSL. The vicinity of the pass is partially visible to weather reporting station at Grand Junction.

Fremont

Route: Dillon Valley to Arkansas Valley and Leadville. Road elevation 11,320' MSL. This pass is not visible to any weather reporting stations. This is not a commonly used pass. N39-21-49, W106-11-21.

Gore Pass

N40-04-30, W106-33-49.

Hagerman

Route: Leadville to Aspen. Approximate trail elevation 11,960' MSL. This pass is visible to the weather reporting station at Leadville. Elevation, terrain features, and weather often favor this pass over Independence Pass. N39-16-03, W106-29-34.

Hayden

Route: East-west pass across the northern Sangre de Cristo Range. Trail elevation 10,709' MSL. This pass is not visible to any weather reporting stations. N38-19-08, W105-49-38.

Hoosier

Route: South Park to Breckenridge. Road elevation is 11,539' MSL. This pass is not visible from any airports or weather reporting stations. This pass provides access from the north to South Park. N39-21-41, W106-03-01.

Independence

Route: Leadville to Aspen. Road elevation 12,094' MSL. This pass is not visible to any weather reporting stations. This is a winding pass over rugged terrain with blind turns. Turbulence with up and down drafts likely. Highway below is open and passable during summer months only. N39-06-28, W106-34-20.

Kenosha

Route: Southwest Denver to South Park and Arkansas Valley. Road elevation 10,001' MSL. The vicinity of the pass sometimes visible to weather reporters at Denver. N39-24-35, W105-45-04.

La Veta

Route: Southwest Colorado and Walsenburg to San Luis Valley and Alamosa. Road elevation 9,380' MSL. Weather reporter at Alamosa can see west side of pass. AWOS station is positioned on this pass. Caution: With high west and northwest winds aloft expect turbulence and up and down drafts. N37-36-34, W105-12-28.

Lizard Head

Route: From Cortez/Delores to Telluride. Road elevation is 10,222' MSL. Telluride Airport has limited vision of the pass.

Loveland

Route: Denver west to Dillon Valley and central mountains. Road elevation 11,990' MSL. This pass is not visible to any weather reporting stations. Although this route follows Interstate 70, the terrain is very rugged. Expect turbulence and down drafts with high winds aloft. N39-39-54, W105-53-11.

Marshall

Route: San Luis Valley and Salida to Gunnison. Track elevation 10,845' MSL. The vicinity of this pass is partially visible to weather observers in Salida and Gunnison. Weather and terrain often favor this pass over Monarch. N38-23-54, W106-14-59.

McClure

Route: Aspen and Glenwood Springs to Montrose area. Road elevation 8,755' MSL. N39-07-50, W107-17-48.

Milner

Route: North Denver via Estes Park to Granby. Road elevation 10,758' MSL. This pass offers a lower alternative to Corona Pass. N40-25-39, W105-48-16.

Monarch

Route: Salida to Gunnison. Road elevation 11,312' MSL. Vicinity of pass visible to weather reporters at Salida and Gunnison. The pass has historically had a great number of crashes. As always with pass flying, attain maximum altitude before approaching the pass. Do not attempt to climb across. AWOS station is positioned on this pass. N38-29-31, W106-19-05.

Mosca

Route: Wet Mountain Valley to San Luis Valley at the Sand Dunes National Monument. Trail elevation 9,740' MSL. Vicinity of pass partially visible to weather reporters at Alamosa. N37-43-39, W105-27-40.

Mosquito

Route: Denver to Fairplay to Leadville. Trail elevation 13,186' MSL. This pass is not visible to any weather reporting stations. This is the highest pass in the United States. High north and northwest winds aloft likely to cause turbulence and strong down drafts. N39-17-09, W106-10-47.

Palmer Lake Divide

Route: Denver to Colorado Springs. Road elevation 7,300' MSL. Weather reporting stations at Denver and Colorado Springs can partially see the area. Low ceilings in Denver and Colorado Springs will generally cause zero ceilings at Palmer Lake. AWOS station is positioned at Monument Hill (Kelly Air Park). N39-09-27, W104-52-49.

Paradox

Route: Grand Junction to Dove Creek and Durango. There is no particular high point along this route, but rough terrain will force flights above 8,500' MSL.

Poncha

Route: Salida to Alamosa. Road elevation 9,015' MSL. Pass vicinity is partially visible to weather reporters at Salida and Alamosa. N38-24-47, W106-04-55.

Rabbit Ears and Muddy

Route: Kremmling to Steamboat Springs and Craig. Road elevations - Rabbit Ears 9,426' MSL, Muddy 8,772' MSL. Rabbit Ears is visible from Steamboat Springs Airport. Expect turbulence and down drafts. N40-23-33, W106-38-58.

Red Mountain

Route: Montrose to Durango. Road elevation 11,120' MSL. Pass is not visible to any weather reporting stations. Caution: route includes long stretches of rugged terrain. N37-55-20, W107-44-19.

Tennessee

Route: Arkansas Valley and Leadville north to Eagle and Vail Valleys. Road elevation 10,424' MSL. This pass is visible to weather reporters in Leadville. This is a commonly-flown northbound route through the central mountains. N39-22-09, W106-18-52.

Trout Creek

Route: South Park to Buena Vista and Arkansas Valley. Road elevation 9,346' MSL. This pass is not visible to any weather reporting stations. This is one of the lowest routes into the central mountains. N38-53-43, W105-58-24.

Ute

Route: Colorado Springs to South Park. Road elevation 9,165' MSL. This pass is not visible to any weather reporting stations.

Vail

Route: Dillon Valley to Eagle Vail Valley. Road elevation 10,606' MSL. AWOS station positioned at Copper Mountain. N39-32-38, W106-12-26.

Weston

Route: South Park west to Arkansas Valley, Leadville, and central mountains. Approximate trail elevation 11,960' MSL. Vicinity of pass is visible to weather observers in Leadville. Caution: Strong down drafts and turbulence. This pass is a narrow canyon with a blind turn on either end. N39-07-57, W106-10-43.

Wilkerson

Route: Colorado Springs and south Denver west to South Park and central mountains. Road elevation 9,507' MSL. This pass is not visible to any weather reporting stations. The Badger Mountain R.C.O. is located on the peak to the north side of the pass. N39-11-52, W105-28-40.

Wolf Creek

Route: Alamosa to Durango. Road elevation 10,857' MSL. The pass vicinity is partially visible to weather reporters in Alamosa. AWOS station is positioned on this pass. N37-29-21, W106-47-43.
