The Agricultural Experiment Station

FORT COLLINS, COLORADO.

Poudre River Bulletin.

June 18 to June 24, 1902.—The river for the week has steadily dropped from 1051 cubic feet per second for June 18 to less than 800 feet June 24. The average for the week has been 904 second feet, while the normal for the same time for 19 years have been 1909 cubic feet per second. The week has been the lowest of any week of which we have record save 1896. It is apparently considerably lower than 1888, and actually still lower as there was no water entering the river from other watersheds in 1888.

The rainfall for the week covered by this record is .49 inches and since the 24th, rains have given 1.21 additional, doing much good to crops. The month of June is now above the average in rainfall, though the rainfall for the year is deficient.

The following is the record for the week in second feet:

_		1902	1901	Normal
June	18	1,051	.1.940	
**	19	996	1.970	2 003
6.	20	927	1.913	1.91
**	21	886	1.997	1,968
**		848		
**		825		
*6		796		
Aver	age	904	.2,027	1,909

The following is the record for the corresponding week in previous years:

18811.065	18901.276	18971.440
18844,573	18911,544	18981.464
18852,088	1892	18993.380
18861,374	18932,121	1900,
18871,376	18941,561	19012,027
18881,081	1895 1,863	1902 904
18891,369	1896 842
